European pupils generally leave Bechuanaland to pursue their secondary education in the Union of South Africa or in Southern Rhodesia. About 220 European children were being educated abroad in 1956. The number of African students attending extra-territorial secondary general and technical institutions is decreasing rapidly as facilities in Bechuanaland improve. (See Table 2.)

Examination results in secondary education, 1953–57. The number of African pupils reaching the Junior Certificate level was 47 in 1957 compared with 20 in 1953. There were two matriculation passes in 1956, this being the first occasion on which Bechuana students were successful in this examination. Thirteen Africans passed the final teacher training examination in 1957 compared with 11 in 1953 and 19 in 1956.

Educational finance, 1957. Total expenditure on education in the fiscal year beginning in January 1957 amounted to 246,900 pounds sterling or approximately £0.7 per inhabitant. Of the amount spent, 36 per cent (£88,147) was contributed by the Central Government from territorial revenue, 16 per cent (£38,959) came from United Kingdom funds, 40 per cent (£99,794) from local authorities, and 8 per cent (£20,000) from voluntary agencies. African schools accounted for 76 per cent of total expenditure on primary education and at the secondary level for more than 90 per cent. Expenditure on vocational education and teacher training was exclusively for Africans. Capital expenditure (£73,911) was nearly 30 per cent of the total. The distribution of recurring expenditure by level and type of education is given in Table 1.

FEDERATION OF RHODESIA AND NYASALAND

The Federation was brought into existence on 4 September 1953. It consists of the self-governing territory of Southern Rhodesia and the protectorates of Northern Rhodesia and Nyasaland, all of which retain the constitutional status they had before federation. The Constitution vests responsibility for non-African education and higher education in the Federal Government; primary and secondary education of African children remain functions of the separate Territorial Governments.

NON-AFRICAN EDUCATION

THE EDUCATIONAL SYSTEM

The Federal Ministry of Education was established on 1 July 1954 when the Federal Government took over responsibility for non-African primary and secondary education. Until 31 December 1956 the Ministry operated by virtue of the three territorial education laws, modified, where necessary, under the Territorial Laws Amendment Act.

A draft Federal Education Bill was prepared and published towards the end of 1955. This draft Bill was studied by school councils, the non-statutory Education Advisory Board, and various interested bodies, and in the light of representations which were made, a second draft Bill was published on 15 June 1956. This Bill was presented to the Federal Assembly and was passed with minor amendments, and the act was promulgated on 1 January 1957.

The new Education Act drew mainly upon the legislative experience of the Territorial Governments which preceded it.

The Act gives authority for the establishment of schools, educational institutions and classes, and lays down that tuition at all government schools shall be free to children whose parents are resident in the Federation. The conditions under which a general purpose fund may be established by a headmaster are laid down. General purpose funds are to finance extra-curricular activities which have as their object the spiritual, physical and intellectual welfare of the pupils.

The Act provides for the registration of privately-run schools, and thus assures that proper standards of accommodation, staffing, curricula, and teaching practice are adopted initially, and maintained.

All schools, whether government or private, are required to conform with, and observe, the requirements of the Ministry of Health, and the Act provides for medical and dental inspection of all pupils, in addition to the usual requirements for the control of communicable disease.

The English language is to be used as the medium of instruction in all schools, but at the same time it is recognized that where there is an inadequate knowledge of English, instruction in the vernacular language may be given for a limited period in order to facilitate and expedite the use of English. Where a language other than English is necessary for the purposes of religious instruction, the Act authorises the use of such language by clergymen.

A principle, hitherto peculiar to Southern Rhodesia, by which ministers of recognized religious denominations are

entitled to enter government schools for the purpose of giving religious instruction to the pupil adherents of their denominations, has been extended to the entire Federation. The exercise of this privilege is subject to safeguards relating to conscientious objection by parents of pupils. If the ministers are unable to undertake the work, the principal of a school must arrange for the religious instruction of the pupils, but a teacher who has religious objections may not be called upon to participate.

Pupils who are unable, by reason of distance, to attend school as day-scholars are accommodated in government hostels for which parents pay a sub-economic boarding fee. In addition, transport, maintenance and other grants are available to indigent parents.

The Act embodies the principle of compulsory education for all non-African children from the age of 7 years until the pupil has reached the age of 15 years, but includes provision for a member of a class or groups of persons to be declared exempt from the ruling regarding compulsory attendance at school. All European children and all non-European children who live within three miles of a school are compelled to attend school.

The establishment of an Education Advisory Board, whose function will be to advise the Minister on matters of importance in the field of education has been provided for, and provision has also been made for Regional Advisory Boards. Recognition is given to teacher and parent-teacher associations and to school councils.

The pupil who, because of mental or physical disability, is unable to participate in, or benefit from, normal educational classes is provided for in the Education Act. Provision is made for the establishment and maintenance of special schools, educational institutions or classes and, in addition, for the making of grants or loans to enable such handicapped children to attend non-government institutions whether within or outside the Federation. In pursuance of these provisions, the Government has established certain special schools and institutions, and has established special classes for the teaching of educationally sub-normal pupils.

THE DEVELOPMENT OF SECONDARY EDUCATION

Southern Rhodesia

In Southern Rhodesia the first steps in the establishment of schools were taken by the churches. In October 1892 the first European school in the country was opened in Salisbury by the Dominican Sisters, and this was soon followed by other church schools. The first undenominational school was opened in Salisbury in 1898 by the Salisbury Public Undenominational School Committee.

In 1899 the first Education Ordinance was promulgated. This established an Education Department which took over the supervision of government aid and in due course began to control some existing aided schools and to establish new government schools. In 1910 the first two grants were made by the Beit Trustees to enable two women teachers to be trained at Grahamstown. By this time the country was becoming more settled and new schools were being opened at the rate of 10 or 12 a year.

In 1923 the establishment of responsible government saw a great increase in provisions for new schools and hostels. Commissions were appointed, one in 1929 and one in 1935, to inquire into the educational system of the Colony. In 1938 the Education Act was promulgated. This tightened up the law with respect to the compulsory education of Europeans and introduced a certain amount of compulsory education for non-Europeans.

Northern Rhodesia

The British South Africa Company opened its first school for European children in 1912. From 1914 to 1919 the Education Department of Southern Rhodesia advised on education in Northern Rhodesia and conducted annual inspections. Formal ties then ceased, but the Department in Salisbury continued to manifest a sympathetic interest in European education in Northern Rhodesia.

In 1925 an Education Department was created, and in 1942 the European Education Ordinance came into force, providing for the compulsory education of all European children between the ages of 7 and 15 living not more than three miles from a government school.

Nyasaland

The early history of education in Nyasaland was necessarily concerned mainly with the development of education for Africans, and this remained the major part of the work of the Education Department.

For many years children of mixed blood were educated in mission schools, but 1947 saw the opening of the first government school for Eurafricans. Private Indian schools were maintained at various centres and managed by Indian school committees; salary grants for properly trained teachers were made by the Government. By 1953 there were, for European children, three full-range government primary schools.

Federation

In July 1954, after the Federation of the three Territories, the Federal Government assumed responsibility for the education of non-African children and for the higher education of all students resident in the Federation. In so far as these responsibilities were concerned, the duties of the three Education Departments were taken over by the Federal Ministry of Education.

Administration

The Ministry of Education is controlled by a Secretary for Education. Under the Secretary are five officers, the Chief Inspector, the Chief Education Officer, the Under Secretary, the Assistant Secretary (Administration) and the Assistant Secretary (Finance).

The Chief Inspector is in charge of a staff of 14 inspectors who are responsible to him for the inspection of the work of the schools. The inspectors are recruited from the teaching service, and are selected on the basis of suitability in regard to human relationships, and ability to carry out inspection of subjects so that the whole field of the primary

and secondary curriculum is covered. The Inspectorate is distributed in Salisbury, the main centre of the Federation, Bulawayo, Lusaka, Ndola and Blantyre. There is a Senior Inspector at each centre who works in close liaison with the respective Regional Director, so that he is in a position to deputize when the need arises.

The Chief Education Officer and the Under Secretary share the administrative duties which arise in connexion with the teachers, pupils, school buildings and general provision for education.

The Assistant Secretary (Administration) is generally responsible for the proper functioning of the ministry's office staff, and is responsible for legal interpretations of regulations.

The Assistant Secretary (Finance) keeps account of the revenue and expenditure of the Ministry.

The Federation is divided into five regions each in charge of a Regional Director, who is responsible for the detailed administration within his region.

Planning and policy. The Secretary and his senior officers undertake the planning in regard to staffing, curricula, equipment, school buildings, attendance of pupils, hostel accommodation, internal and external examinations, and technical education in terms of the policy laid down by the Minister.

The Federal Education Advisory Board, which is comprised of professional officers as well as laymen, functions in an advisory capacity to the Secretary, while the five regional advisory boards assist in a similar manner.

Finance. Educational expenditure is financed out of national taxes devised by the Federal Government.

The main heads of expenditure are salaries, wages and allowances, school buildings, hostel accommodation, grants for teacher training, textbooks and equipment, and water, light and sanitary charges. The total bill in 1958 was nearly £8 million.

No tuition fees are charged for the secondary stage of education in government schools, and textbooks and stationery are supplied free of charge.

Private schools are assisted by a grant of £20 per annum per pupil in attendance at the school.

Hostel accommodation is provided at nearly all secondary schools. Eligibility for admission as boarders is restricted to those pupils whose parents are resident nine miles or more from a school providing suitable educational facilities. The fees are £81 per annum.

Parents who are unable to meet the cost of boarding may be awarded grants on a means test.

Buildings and equipment. A Schools Building Planning Group, composed of officers of the Ministry of Education and the Department of Public Works, meets regularly to discuss all matters connected with buildings, playing-fields and sites.

Standards in such matters as size of rooms, playing-field areas, sanitation, lighting, ventilation, etc., have been laid down. Plans of new buildings are scrutinized before being accepted by the Ministry.

School welfare services. The Ministry of Health provides a service by which every child is medically examined, and a dental service which inspects children's teeth but provides treatment only for those who can prove whole, or partial, indigency.

The Department of Social Welfare provides clothing grants for children of destitute parents.

TYPES OF SECONDARY EDUCATION

General secondary schools

Children normally pass from primary to secondary schools at the age of 12 +.

With the exception of two technical high schools, the government secondary schools of the Federation may be regarded as multilateral. They each accept all comers (from a declared zone) and offer a variety of courses to suit pupils of varying interests and levels of ability. The courses available in each normal secondary school may be described briefly as follows.

Academic. The most able pupils follow an academic course, similar to that of grammar schools in the United Kingdom, which leads to external public examinations organized from overseas. The first examination—Cambridge Oversea School Certificate—is taken at the end of four years, after which a large proportion of the pupils proceed to the 2-year Sixth Form course leading to the Higher School Certificate of the Cambridge Syndicate. Success in this examination provides the qualifications necessary for admission to universities and the higher professions. As a matter of interest, it may be noted that a credit in the Cambridge Oversea School Certificate and a pass in the Higher School Certificate are regarded as equivalent to Ordinary and Advanced level passes, respectively, in the General Certificate of Education.

Slow academic. The slower academic course is followed by pupils who take the Cambridge Oversea School Certificate in their fifth year, probably, but not necessarily, having taken the College of Preceptors Certificate in their fourth year. In this course schools make provision for such subjects as commerce, typing, housecraft, woodwork, metalwork, technical drawing, etc. These practical subjects may be offered for both the College of Preceptors and the Cambridge Oversea School Certificate examinations.

General. Pupils following a general course are those whose requirements will be met by a full, or partial, College of Preceptors Certificate. Again, the choice of subjects permits pupils to take a variety of practical subjects in addition to the normal English, mathematics and science.

This system of examination affords pupils every opportunity to follow courses of their choice as far as their ability enables them to go. It is, for instance, unlikely that many pupils from the slow academic stream will wish to proceed to the 2-year Higher School Certificate course, but there is nothing to prevent their doing so, if they have shown that they have the capacity for study at this level.

Technical high schools. These two schools provide education with a technical bias for boys (not girls) of good ability whose bent is towards mathematics, science and technology rather than towards arts subjects. Despite the different emphasis in the curriculum, the examinations taken are

the same as those listed above for other high schools, and at the top level (Higher School Certificate) boys are prepared for admission to universities, or to courses of the Institutions of Engineering. The intention of these schools, like the others, is to provide a good all-round education, but commercial subjects are not catered for and subjects such as Latin are not included in the curriculum. Although the bias in these schools is technical, their purpose is not to train boys for any particular occupation: this is regarded as the function of industry and the technical college, after secondary schooling has been completed. As these two schools can offer only a limited number of day and hostel places, admission is gained on the results of an entrance examination. A pupil who fails to gain admission to a technical high school is not debarred from obtaining technical education; he may take a course including a number of practical/technical subjects at the normal secondary school to which he is admitted.

A note on curricula generally. Lest it should appear that the courses offered are determined solely by examination requirements it should be pointed out that cultural subjects and activities are a feature of the curriculum in all schools. Religious instruction, music and physical education form part of the curriculum for all pupils, and art and the light crafts have a prominent place particularly in the courses offered to the general stream. When pupils study a second language they are usually offered the choice of French or Afrikaans. One or two schools in recent years have offered German as an alternative to French.

Placing of pupils in appropriate courses. The choice of course to be followed by any child rests with the parents, but ability is obviously a limiting factor, and parents are warned that the selection of a course against the advice of the heads of primary and secondary schools may have a harmful effect on the child and may endanger his, or her, educational future.

The normal procedure adopted by secondary schools is to examine all entrants to form 1 shortly after their admission. For this purpose, standardized tests in the key subjects of English and arithmetic, and in general intelligence, are usually employed. On the combined results of these tests and taking into account information received from the primary school, principals inform parents of the course for which their child appears to be best suited, and of the division of form 1 in which he or she has been placed. The dividing lines between the various form 1 classes in any school are generally indistinct and the classification at this stage is not final. In fact, the form 1 year is regarded as a period of observation during which all pupils may be following approximately similar courses, but at different rates, so that they have an opportunity of showing their capabilities. The placing of pupils is reviewed at some stage during the first year by means of tests and the work actually done. Even in later stages of the secondary school changes of course are possible, but wide moves are rendered difficult by variations in the curricula which are followed by the different streams.

The school year. The school year, which starts in late January and ends in mid-December, is divided as nearly as possible into three terms of equal duration. The working week is from Monday to Friday and the school calendar is devised so as to provide approximately 195 school days each year.

School hours are normally from 8 a.m. to 1 p.m. with a half-hour interval, thus providing 4½ hours of actual teaching time daily. In most secondary schools the morning programme is supplemented by periods of afternoon study, particularly for senior students engaged in practical work in the laboratories. Attendance at these afternoon sessions is voluntary, but generally only older pupils are affected and the percentage of absentees is negligible.

Teaching staff. The secondary schools are staffed mainly by graduates trained at South African or overseas universities, with, in recent years, a small but increasing number of recruits from the University College of Rhodesia and Nyasaland. A relatively small proportion of the body of teachers in secondary schools consists of non-graduates, most of them appointed after experience in secondary modern schools in Britain. The Federation's own Teacher Training College is now training a small number of non-graduate teachers for work in the lower forms of the secondary schools. Married women are employed in considerable numbers particularly in co-educational or girls' schools. They are usually appointed on a temporary basis although they are eligible in certain circumstances for appointment on pensionable terms.

Posts of special responsibility are allowed to secondary schools on a basis of enrolment. Most of the posts are occupied by teachers in charge of subjects (or courses), who themselves teach up to sixth form level and accept responsibility, under the head, for the organization and supervision of their subject throughout the school.

Technical institutions

There are two technical institutions, the Salisbury Polytechnic and the Bulawayo Technical College, controlled and financed by the Ministry, which provide post-school education for persons over school age on a full-time and part-time basis as is required by local industry and commerce. Leisure time classes, of a cultural and practical value, are classified as adult education and are self-supporting.

Advisory bodies are nominated by societies, associations and bodies approved by the Government.

Craft courses form an integral part of the requirements of apprenticeship and attendance is compulsory as laid down by statutory law. Close liaison between industry and the college exists through the various local joint committees of the industrial councils for the building, motor and engineering industries. The system of implementing the statutory requirements will be superseded in January 1960 by an Apprenticeship Board which will take over all the functions appertaining to apprenticeships previously administered by the local committees.

Entry into the course may be preceded by a preliminary craft course of one year's duration or, under certain conditions, direct entry to the craft course is permitted. The minimum age is 16 years, and the educational entry qualification is a pass in English and mathematics or arithmetic at standard 7 level.

Engineering

Craft level (usually a full morning release with one evening lecture). Courses aiming at the City and Guilds of London examinations in such subjects as machine shop engineering and refrigeration, motor vehicle mechanics and electricians work, electrical fitting and fabrication of steelwork. Owing to small numbers, Union of South Africa examinations are taken (augmented with practical work) in sheet-metalwork, boiler-making and welding, and in Salisbury aircraft engineering.

Technicians (one complete day release with evening lectures). City and Guilds courses aiming at the overseas certificates in mechanical and electrical engineering; telecommunication engineering, radio and television servicing courses have also been initiated.

Engineering technology (and allied technologies). Courses leading to the examinations of the major professional engineering institutions, London, i.e., the Institutions of Mechanical, Civil and Electrical Engineers, together with the Institutions of Structural and Municipal Engineers, Chemical Engineers, the Institute of Brewing and Institutions of Rubber Industry.

Building

Craft level. Courses aiming at the City and Guilds examinations in carpentry and joinery, brickwork, plasterers' work, painters' and decorators' work, plumbers' work and electrical installations.

Technicians. A building course designed to meet the requirements of students who intend to occupy a technical or administrative position in the industry. Union of South Africa Technical Certificates and City and Guilds Overseas Certificates are the aim of this course.

Advanced building course. Course leading to the Advanced Technical Certificates of the Union of South Africa, the Diploma of Building of the Union of South Africa or the Institute of Builders (London) Licentiate Diploma; Association of Building Technicians, Clerk of Works Diploma examination; Institution of Municipal Engineers examination; Building Inspectors examinations; and the Institute of Quantity Surveyors, Intermediate examination.

Printing (in Salisbury only). Courses in lithography, letterpress machine minding, composing, binding, stereotyping and electrotyping and printing science. Workshop equipment is being rapidly installed.

Mining (in Bulawayo only). Courses for surveyors, assayers, samplers, etc.

Commerce

Full-time courses (1 year and 1½ years). These include courses for private secretaries or shorthand-typists, and various courses offering general commercial training. Students who have attended classes at a college may proceed to advanced training as second-year students. Students are also accepted for separate subjects in shorthand-typewriting, dictaphone-typewriting, and bookkeeping.

Evening classes. These include commercial courses—book-keeping to diploma grade, shorthand, typewriting to diploma grade and Civil Service Lower Law—and professional courses leading to the examinations of the following bodies: Chartered Institute of Secretaries, Corporation of Secretaries, British Institute of Transport, British Institute of Management, Institute of Cost and Works Accountants, Institute of Bankers, Institute of Book-keepers.

Adult education (part-time classes only). The subjects chosen in this Department mostly have a practical appeal.

Women's subjects. Cookery, cake icing, floral arrangements, dressmaking, millinery and pattern drafting.

General subjects. African languages of Shona, Nyanja, Sindebele and Basic Bantu; fine art, motorcar maintenance, woodwork, photography, printing, gardening, English for foreign students, Portuguese, salesmanship, oil technology, steel, fibres and dyeing.

Management studies. Various courses are conducted in this field from time to time, mainly aiming at the lower levels of management, under such sub-headings as basic organization, personnel management, sales function, production organization, managerial accounts, and management/labour relations.

The Copperbelt Technical Foundation

This foundation has assumed responsibility for technical education on the Copperbelt. Four colleges, one in each of the large Copperbelt towns, have been opened.

While the work of the institutions is mainly connected with the training of apprentices, classes have been opened for commercial subjects and adult education.

The Government assists the foundation with a grant to meet the cost of recurrent expenditure.

Technical centres

At 10 centres in the Federation classes are provided for commercial and technical students. The centres are staffed by teachers who are employed as part-time teachers. It is proposed to build accommodation for these centres at as early a date as possible.

Out-of-class activities

In the general secondary schools the combination of afternoons free from lessons and a favourable climate makes possible a wide range of out-of-class activities. Sport features widely. Most schools have extensive playing fields and offer sporting activities within the following range: rugby, cricket, soccer, hockey, tennis, netball, baseball, squash racquets, athletics, and swimming (many schools have their own swimming baths). Other activities include: cadets, dramatic societies, debating societies, science societies, chess clubs, hobbies' clubs, young farmers' clubs, Boy Scouts, Girl Guides, art societies, dancing (ballet and ballroom), school orchestras, angling societies, philately, music appreciation, photographic societies, etc.

The Teachers' Association and the Ministry organize overseas tours for senior pupils with parties of boys and

girls travelling alternate years. There is also a very flourishing Rhodesian Schools Exploration Society which undertakes work which would normally fall to the lot of the national museums or the National Monuments Commission, if these bodies had the necessary personnel and finance available. As it is, officers from the museum accompany the expeditions and act as group leaders. Specimens of plants have been sent as far afield as Kew Herbarium.

TRENDS AND PROBLEMS

The year 1959 has seen a change of focus from the Cambridge Oversea School Certificate to the Higher School Certificate with its sterner academic discipline and more exacting demands. From now on the only route to the university for students will be via a 2-year post-certificate Course. This higher entrance qualification is required even by the universities of the Union, whose requirements for South African pupils remains at the slightly lower matriculation level, as well as by the University College of Rhodesia and Nyasaland.

The change is welcomed by the Ministry who have for some time regretted the immaturity of many university entrants who left school with credits in the Cambridge Oversea School Certificate after only four years' secondary education. The repercussions upon the schools cannot fail to have a stimulating effect. More students are remaining at school for a full sixth form course and it is to the good that the school leaders are now, in the main, scholars as well as sportsmen. This trend has, of course, its concomitant difficulties reflected in the need for extra classrooms, for extra subject specialists and for extra boarding accommodation.

Within the technical schools there is a very definite change in character brought about by the continued implementation of a policy which demands selective entry. There has at times been a danger that these institutions might degenerate into quasi-trade schools for scholars who had admitted defeat in the academic field. Such a danger no longer exists for, consequent upon the elimination of pupils less well endowed intellectually, there has arisen an increasing consciousness that the function of these schools is to give their pupils a broad cultural education to which interest is added by a heightened awareness of the practical world around them. It is a natural development from this wider conception of technical education that there has been a move in these schools towards the Cambridge Oversea School Certificate and Cambridge Higher School Certificate examinations. These examinations are at present supplemented by the South African National Technical examinations but, from 1961 onwards, the pattern will change with the introduction of the College of Preceptors examinations and the progressive running down of the national technical and commercial courses.

The introduction of the College of Preceptors examinations raises the question of their evaluation as a qualification for admission to technical college courses and to apprenticeship at varying levels. These matters are now under consideration.

In general, it can be said that the main trend in secondary education has been an increased demand for higher education and a growing awareness of the need for a quickened tempo. Linked with this has been a review of the current examination system with the object of determining whether students are being stretched to their fullest capacity. The 'content' of secondary education grows almost monthly and necessitates a corresponding growth in effort.

AFRICAN EDUCATION

SOUTHERN RHODESIA

The educational system

In 1956 the Prime Minister assumed the responsibilities of Minister of Native Education, and the Director of Native Education, who heads the Department was also appointed Director of Native Development. These steps were taken because of the rapid growth of African education in Southern Rhodesia.

In the Department of Native Education the Director is assisted by a senior inspector and an administrative officer at headquarters. The country is divided into five divisions each controlled by a divisional inspector with several circuit inspectors on his staff. The inspectors are responsible for visiting both government and aided schools to ensure that standards are maintained.

The Government has progressively taken more direct action in providing schools—mainly secondary and large urban primary schools—which are financed fully by the Department.

Historically, the African school system was begun by missionary enterprise, and still today the great bulk of education is undertaken by missions which receive from the government teachers' salaries, and grants towards equipment and boarding establishments. Each of the main missions has an internal administrative system of its own, with superintendents of schools who visit all schools under their charge four times a year. Co-ordination of the work of the various educational agencies is obtained through the Education Advisory Board. This has mission representation and it discusses and advises the Government on all matters affecting the administration of native education. In salaries and salary grants there is complete parity between government and aided school teachers and no loss of service occurs when teachers move from one service to the other.

Education is controlled legally by Acts of the Legislative Assembly—the latest being that of 1959—and by regulations issued by the Department. A 5-year development plan for African education was started in July 1956. It set the main lines for expansion, with emphasis on the provision of secondary school and teacher training facilities.

With the rapid growth of secondary education in recent years, the chief inspector has assumed responsibility for carrying out team inspections assisted by a number of inspectors so that languages, sciences, and general subjects are fully covered.

Types of secondary school

The full primary course lasts 8 years, and leads to a public

examination which is controlled by the Department. Access to secondary schools is decided by the individual schools through a separate examination of applicants.

The secondary school course comprises six forms; after the second, students take the Southern Rhodesia Junior Certificate examination, after the fourth, the Cambridge Oversea School Certificate examination, and some few schools have the higher level course in forms 5 and 6.

Government secondary schools were originally boarding schools only, but lately a number of urban day commercial courses are offered. The majority of general secondary schools are aided schools with the 4-year course. The medium of instruction is English, and curricula and syllabuses are worked out by individual schools in the light of examination requirements.

The largest group of vocational schools are those training primary teachers. Both the Government and missions maintain teacher training schools which provide 2-year courses at two levels: the higher recruiting from students who have passed the junior certificate, and the lower following immediately on primary education. A number of centres also train domestic science teachers. Under the development plan teacher training is expanding rapidly, but the demand for new teachers is so great that it is not yet possible to convert the lower courses to the higher standard.

Industrial schools also provide a curriculum at secondary level. The government schools are residential and have courses in agriculture, building and carpentry lasting 4 years; a 3-year course for health demonstrators and another for leatherwork have recently been added. Aided industrial schools follow a similar pattern, submitting their students for the departmental elementary industrial examination. The missions have evolved also a number of homecraft schools, designed to meet the needs of women who have not been able to obtain a full primary education but who wish to learn about cooking, sewing, baby care and all the requirements which go to make a home.

NORTHERN RHODESIA

The educational system

African education forms part of the portfolio of the Member for Education and Social Service in the Legislative Council, at which level policy is decided. The Education Department is headed by a Director who is assisted by a specialist staff at headquarters; he acts also as chairman of the African Education Advisory Board, a body representing the various educational interests in the Territory, which meets annually to advise the Governor on matters of policy.

Below the territorial level there are local education authorities, one for each of the seven provinces and one for each rural or urban administrative district in the country. Provincial education officers serve as chairmen of the provincial authorities and are responsible for the control and supervision of all public and aided schools in their areas.

The system of education in Northern Rhodesia has always been based on co-operation between the Government and voluntary agencies, normally missionary societies. While the number of local authorities schools is now increasing rapidly, the missions still manage a large proportion of schools and maintain administrative and supervisory services for them.

The government's financial assistance to the missions and local authorities covers a wide field: teachers' salaries payable in full according to approved scales, equipment and boarding grants and, for approved school buildings, between 75 and 100 per cent of the cost.

A 10-year development plan (1947–56) was adopted after the war to provide for a rational expansion of the school system. A new plan, drawn up in 1955, had to be postponed until 1957 because of financial stringency. In general, educational policy is closely related to the country's economic and social policy. The long-term aims of the Department may be summarized as being: (a) to provide universal primary education as soon as possible; (b) to equip further, through secondary education and technical training, the numbers required to take part in the administrative and social services and in the industry, trade and commerce of the territory; (c) to assist in building up stable rural communities; (d) to assist economic development through trades and technical training schemes; and (e) to assist community development programmes and the production of suitable literature.

Types of secondary school

The African education system of Northern Rhodesia is divided into primary (8 years, with lower and upper cycles of 4 years each) and secondary ($4\frac{1}{2}$ years, the first 2 years forming the junior secondary course). At the end of the full primary course pupils take a departmental examination for the primary school leaving certificate. Selection for admission to secondary schools is carried out on a territorial basis and all the principals of junior secondary schools assemble annually for this purpose. Examination results, age, place of residence and headmasters' reports are among the factors taken into account.

The general secondary schools comprise junior and senior schools. The former have a 2-year course with mathematics, Latin, French, health science, metalwork, woodwork and book-keeping added to the subjects carried forward from the primary curriculum (including the two main vernacular languages). English is used as the medium. A departmental junior secondary school leaving certificate is taken at the end of the course. In senior secondary schools, students continue for two and a half years to the level of the Cambridge Oversea School Certificate. One school offers in addition sixth form work (two years) to the higher level required for admission to the University College of Rhodesia and Nyasaland.

Technical and vocational schools show a similar pattern as to level. Primary school leavers may go to trades schools run by local authorities and missions, where the courses of 3 years are directed chiefly to the building trades. Vocational training schools are run also by many other Government Departments, such as the medical training schools, the survey school, agricultural and veterinary training school and so on. The normal entry qualification has been the primary school certificate, but there is a tendency to demand completion of junior or even senior secondary school from applicants.

The territory has one technical college with a wide range of courses lasting between 2 and 4 years; the majority of these are at secondary level, but some are at higher level, recruiting students who have completed secondary school.

Teacher training courses take various forms. The department's policy is to build up a few large and efficient colleges in place of a profusion of small denominational institutions where inevitably the training is less diversified. The different courses are described in terms of the teaching certificate to which they lead: T4, a 2-year course for lower primary school teachers, recruiting primary school leavers; T3, a 2-year course following junior secondary school; T2 and T1, both at post-secondary level; and the Higher Teachers' Certificate In-Service Course, which is a modified form of the T4 but reserved for experienced teachers.

NYASALAND

The educational system

The Department of Education, headed by a Director, comprises a headquarters staff and a field staff of education officers in the three Provinces. The Director is responsible for the general conduct of schools, including the registration and classification of schools and teachers, and for co-ordinating the work of the various voluntary agencies. He is assisted by an Advisory Committee on African Education. The supervision of schools is centred mainly at provincial level, and further devolution for the planning and financing of schools is made to district authorities.

The first schools resulted from missionary enterprise, and today the majority of schools are maintained by the missions. Local authority schools are increasing. Both these types of administration receive financial grants from the Government. The Central Government maintains a few primary schools, but is more active at the post-primary level.

Since 1945 the expansion of education has taken place within the framework of a series of development plans, the current plan covering the period 1957–61. The long-term objectives of educational policy in Nyasaland include: the expansion of primary education towards the goal of universal schooling; the expansion of secondary education with the object of providing opportunities for further education for those pupils whose primary school performance indicates the likelihood of their successfully completing a course of secondary education; the provision of technical education facilities for those whose aptitude is for technical rather than academic skills and for whom there is an employment demand; and the preparation of the best pupils from secondary schools for entrance to universities.

Types of secondary school

The primary course covers 8 years in two cycles (5+3) and leads to the Nyasaland Government Standard 4 examination.

General secondary education is provided by junior secondary schools with a 2-year course leading to the departmental Standard 8 Certificate. Full secondary schools contain this cycle as well as the next cycle of two years which prepares for the Cambridge Oversea School Certificate. More recently, when the University College of Rhodesia and Nyasaland decided to require the Higher School Certificate as its standard of entry, the necessary course of 2 years has been added to one secondary school.

Technical and vocational training is provided by artisan and junior trade training centres at post-primary level with courses lasting up to 5 years.

Teacher training courses exist at three levels: the English grade course (2 years) immediately after primary school, the higher grade course (2 years) after junior secondary education, and the higher training course at a post-secondary level.

STATISTICS: RHODESIA AND NYASALAND

Population (mid-year 1958 estimate): 7,650,000.
Area: 483,829 square miles; 1,253,116 square kilometres.
Population density: 16 per square mile; 6 per square kilometre.

NON-AFRICAN EDUCATION

Summary of school statistics, 1953–57. In 1957 there were 67,959 pupils enrolled in non-African schools throughout the Federation. Of this number 59,787 were in European schools and 8,172 in schools for Asiatic and Coloured children. Of the European children, 43,528 were in schools in Southern Rhodesia, 15,335 in Northern Rhodesia, and 924 in Nyasaland. Of Asia and Coloured pupils, 4,778 were in Southern Rhodesia, 1,562 in Northern Rhodesia and 1,832 in Nyasaland. Compared with 1953, enrolment in European schools throughout the Federation increased by 45 per cent and in Asiatic and Coloured schools by 70 per cent. (See Tables 1, 2 and 3.)

Examination results in secondary education, 1953–57. Non-African candidates in the Federation awarded full certifi-

cates in the Cambridge Oversea School Certificate examinations rose from 988 in 1955 to 1,296 in 1957, representing an increase of 31 per cent. In the Cambridge Higher School Certificate examination, successful candidates numbered 104 in 1957 compared with 60 in 1955. (See Table 4.)

Educational finance. Educational finance for non-Africans is the responsibility of the Federal Government but details of the amounts spent are not available.

STATISTICS: SOUTHERN RHODESIA

Population (mid-year 1958 estimate): 2,640,000.
Area: 150,333 square miles; 389,362 square kilometres.
Population density: 18 per square mile; 7 per square kilometre.

AFRICAN EDUCATION

Summary of school statistics, 1953–57. Total enrolment in African primary and secondary schools at the beginning of 1957 was about 410,000 children, representing 16 per cent of the estimated population. Girls made up some 43 per cent of enrolment in primary schools and 17 per cent in general secondary schools at the beginning and end of the period under review. Enrolment in primary schools represented over 98 per cent of all African pupils; under 2 per cent were in general and vocational secondary schools and teacher training centres. The teaching staff in African schools numbered 11,200 in 1957 of whom 97 per cent were in primary schools; the pupil-teacher ratio in primary schools was 37 and in general secondary schools 22. Compared with 1953, enrolment in primary schools had increased by 53 per cent, in general secondary schools by 157 per cent, in vocational education by 22 per cent, and in teacher training centres by 76 per cent. (See Table 5.)

Examination results in secondary education, 1956/57. In 1956/57 there were 285 African candidates for the University Junior Certificate or Matriculation equivalent and 534, including 80 girls, for the Southern Rhodesia Junior Certificate which is taken in the second year of secondary school. There were in addition some African candidates for the General Certificate of Education but details are not available. There were 75 passes in the Cambridge Oversea School Certificate and 6 in the Cambridge Higher School Certificate in 1956/57. In the same year 632 candidates, including 177 women, passed the Teachers' Lower Primary Certificate and 133, including 14 women, were awarded the Teachers' Higher Primary Certificate.

Educational finance, 1957/58. Expenditure for African education made by the Southern Rhodesia Government amounted to 2,270,425 pounds sterling in 1957/58.[1] This amount does not include any contribution made by the Federal Government.

1. Figures for 1957 are not strictly comparable with those for 1956 and previous years, since they are based on returns supplied at the beginning of the year and not, as in previous years, at the end of the year.

STATISTICS: NORTHERN RHODESIA

Population (mid-year 1958 estimate): 2,300,000.
Area: 288,130 square miles; 746,256 square kilometres.
Population density: 8 per square mile; 3 per square kilometre.

AFRICAN EDUCATION

Summary of school statistics, 1953–57. In the school year 1957/58 enrolment in all institutions for African education totalled almost 236,000 pupils representing about 10 per cent of the total population. Of the African school-going population 98 per cent were enrolled in primary schools, about 1.5 per cent in general secondary and vocational schools and the remaining 0.5 per cent in teacher training courses. The proportion of girls enrolled in primary schools was 37 per cent in 1957/58 against 34 per cent in 1954/55. The number of teachers in African primary schools was nearly 4,800 of whom 16 per cent were women and the average pupil-teacher ratio was 48 in 1957/58 against 41 in 1954/55.

Total enrolment in general secondary schools was 1,600 in 1957/58, an increase of over 114 per cent compared with 1954/55. The number of girls enrolled in 1957/58 was 179, compared with only 45 in 1954/55. In vocational secondary schools enrolment increased to 1,886 in 1957/58, a rise of 15 per cent over 1954/55 but the number of girls declined slightly over the same period. All levels of teacher training courses enrolled 1,306 students in 1957/58 of whom 19 per cent were women. In 1957/58 the pupil-teacher ratio in general secondary schools was 19, in secondary vocational schools 13 and in teacher training centres 15. (See Table 8.)

Examination results in secondary education, 1953–57. The number of secondary school pupils awarded the Cambridge Oversea School Certificate was 87 in 1957/58 of whom 7 were girls. Eight students were awarded the Cambridge Higher School Certificate. In addition 350 children passed the Junior Secondary School Leaving Certificate in 1957/58, an increase of 126 per cent compared with 1953/54. In 1957/58, 36 of the successful candidates were girls, as against only 3 in 1953/54. Teaching certificates were awarded to 436 students in 1957/58, as compared with 263 in 1953/54. (See Table 6.)

Educational finance, 1956/57. Total public expenditure on African education in the fiscal year beginning July 1956 amounted to 2,305,845 pounds sterling. Of this total, £2,173,728 or 94 per cent was derived from territorial revenue and the remaining 6 per cent came equally from native authorities and voluntary missions. Capital expenditure amounted to £541,912 or about 24 per cent of the total spent.(See Table 7.)

1. Including data on schools which offer vocational or teacher training courses.
2. Government maintained and aided schools only.
3. Included in secondary general education.
4. Including higher teacher training.
5. Number of courses.
6. Included in secondary teacher training.
7. In addition there are practical classes for women organized under the 'Badge Scheme', and evening courses for adults are organized in all the mining companies.

STATISTICS: NYASALAND

Population (mid-year 1958 estimate): 2,710,000.
Area: 45,366 square miles; 117,498 square kilometres.
Population density: 60 per square mile: 23 per square kilometre.

AFRICAN EDUCATION

Summary of school statistics, 1953–57. In 1957/58 total African enrolment in primary and secondary levels of education was over 265,500 pupils representing about 10 per cent of total population. About 99 per cent of these pupils were in primary schools and the remaining 1 per cent were divided between general secondary, vocational and teacher training schools. The proportion of girls to total enrolment was 36 per cent at the primary level in 1957/58 compared with 38 per cent in 1954/55. The increase in enrolment in primary schools between 1954/55 and 1957/58 was about 10 per cent. The number of primary school teachers increased by 6 per cent between 1955/56 and 1957/58. The proportion of women primary school

teachers was 11 per cent in 1957/58 and the average pupil teacher ratio was 43.

Total enrolment in general secondary schools increased by 78 per cent between 1954/55 and 1957/58 and the number of girls rose from 29 to 92 over the same period. The proportion of girls to total enrolment was 10 per cent in 1957/58 compared with less than 6 per cent in 1954/55. The pupil-teacher ratio in general secondary schools was 14 in 1957/58 and the proportion of women teachers 18 per cent. Enrolment in technical schools increased by nearly 150 per cent between 1954/55 and 1957/58. Enrolment in teacher training schools rose by 60 per cent between 1954/55 and 1957/58, and the proportion of women students increased from 14 per cent to 21 per cent over the same period. The higher teacher training course (post-secondary) which started with 3 students in 1955/56, enrolled 10 male students in 1957/58. (See Table 10.)

Examination results in secondary education, 1953–57. Information on results of the Cambridge Oversea School Certificate is incomplete but 54 candidates took this examination in 1957/58, against 24 certificates awarded in 1954/55. There has been a steady rise in the number taking the Standard 8 second year general secondary examination and over the period 1953/54 to 1957/58 passes increased from 68 to 180. Successful candidates in the 'English Grade' Teachers' Certificate examination numbered 190 in 1957/58, an increase of 52 per cent over 1954/55; those taking the 'Higher Grade' Teachers' Certificate increased from 32 to 37 over the same period. (See Table 11.)

Educational finance, 1956/57. Total expenditure on African education for the fiscal year beginning July 1956 was 981,254 pounds sterling representing about £0.3 per inhabitant. Of this sum 62 per cent came from territorial revenue, 9 per cent from United Kingdom Colonial Development and Welfare Fund, local authorities contributed 2 per cent and the remainder was derived principally from voluntary missions. Capital expenditure amounted to £235,270 representing 24 per cent of the total spent. (See Table 9.)

SWAZILAND

The population of the Territory is made up mainly of the Swazi, a people akin to their southern neighbours the Zulu. The Swazi, most of whom live in areas reserved for African settlement, have their own native authority headed by the Paramount Chief, and a native treasury, revenue for which is derived from various taxes and fees, including an education levy. Swazi is not yet a written language, and Zulu, to which it is related, is still taught in schools for Africans and generally employed for official purposes. At the time of the 1956 census there were nearly 6,000 European and about 2,000 Coloured or Eurafrican residents.

THE EDUCATIONAL SYSTEM

General education policy for the Territory is laid down by the Resident Commissioner, and embodied in the proclamations which he issues or the notices framed under the existing proclamations. Education is administered by the Government through a fully constituted Department. The school system, and with it the work of the Education Department, falls into three clear-cut divisions—African, European and Eurafrican.

Most of the African schools are provided by missions. The native authority runs a number of tribal schools including three national schools financed by the Swazi National Treasury. The Government directly maintains a number of institutions, including a trade school and a teacher training centre, and aids the majority of the mission schools with grants covering teachers' salaries, and with book and equipment grants. Control is exercised by the Director of Education through the Native Schools Proclamation (No. 6 of 1940), which provides for the registration and inspection of all schools and the submission of returns, through the revised 'Rules Governing the Conduct of African Schools' gazetted in October 1954, and for the Swazi national schools through Government Notice No. 27 of 1944. Education is not compulsory for African children. Education advisory committees at district level bring together representatives of the native authority, missions and parents under the chairmanship of the District Commissioner. The Territorial Board of Advice on African Education, which meets annually under the chairmanship of the Resident Commissioner, includes representatives of the native authority, the missions, the district advisory committees, the Medical and the Agricultural Departments.

The Education Department exercises control of European Education through the Swaziland Public Education Proclamation (No. 31 of 1943). All European schools except one grant-aided convent are maintained by the Government, and each government school has a committee, elected by parents, which meets quarterly under the chairmanship of the District Commissioner. At territorial level the School Board, membership comprising representatives of the committees, meets annually under the chairmanship of the Resident Commissioner. The committees and the School Board are advisory bodies. Education is compulsory for all European children from 7 years of age until the completion of the 16th year or an earlier passing of the Junior Certificate (lower secondary) examination taken in standard 8.

The Eurafrican community is served by government-aided mission schools the majority of which have boarding establishments. Control is exercised through Proclamation No. 60 of 1951. There are parents' advisory committees and a central advisory board for the Territory as a whole. Education is not compulsory.

Structure of the educational system. All three school ladders (African, European and Eurafrican) begin with an 8-year primary course made up of sub-standards A and B and standards 1 to 6. African primary schools are classified as higher (full course), lower (up to standard 4), and elementary vernacular (up to standard 2). African post-primary institutions include junior secondary schools (3 years), high schools (5 years), a trades school (4 years), a housecraft centre (2 years), and teacher training centres with 2-year courses at different levels. Non-African post-primary education is given in junior secondary schools (2 years) or high schools (4 years). For other types of education and all forms of higher education Swaziland students of all races attend institutions outside the Territory. The study of English is introduced at the first stages of African primary education and in other schools where the mother tongue is Afrikaans. It is the sole medium of instruction at secondary level.

THE DEVELOPMENT OF SECONDARY EDUCATION

African education. Until the early 1950s little was done to develop secondary education in the Protectorate. Up to then Swaziland pupils could enrol at post-primary institutions in the Union of South Africa, and the principal contribution of the Protectorate Government towards the provision of schooling at this level took the form of a fairly large number of bursaries. There were however Junior Certificate classes at the Matapha national school, founded in 1928, and at two grant-aided mission schools. Teacher training, begun in 1936 at the Nazarene mission in Bremersdorp, was given official recognition two years later. A government trades school was founded in 1946 at Mbabane.

The decision of the Union Government that extra-territorial African students should not be admitted to South African secondary and vocational schools from 1954 onwards resulted in a considerable expansion of local facilities. With government assistance the Matapha national school and the Methodist mission school at Mahamba were developed into high schools while a third was founded at Bremersdorp by the Catholic mission. In addition to the high schools, which offer a full secondary

course leading to matriculation (university entrance), a number of junior secondary classes were formed, most of them attached to mission schools. The year 1952 saw the establishment of a government teacher training centre at Matapha and of a government-aided housecraft training centre at the Mbuluzi mission station.

The general aspects of administration have been mentioned above. The Matapha school is controlled by the governing body which was set up to manage all Swazi national schools and which comprises nominees of the Paramount Chief, of the parents and of the Resident Commissioner. All secondary institutions are subject to inspection by the Education Department.

Pupils in high schools and junior secondary schools must purchase their own textbooks and stationery and pay tuition fees ranging from £1 to £5 per annum. Where hostel establishments exist boarding fees range from £8 to £20 per annum. At the Mbabane Trades School an inclusive fee of £22 10s. covers board and tuition for the whole 4-year course. At the Government Teacher Training Centre the inclusive fee is £15 per year. A large number of bursaries are awarded.

The standard of classroom buildings is generally high. By law, window space must be not less than one-sixth of floor space and 12½ square feet of floor space must be allowed for every child on the roll. All post-primary schools have, or are being provided with, their own science laboratories.

School medical services include routine examination of pupils by Medical Department or missionary doctors and inspection of school premises.

European education. Full secondary education is provided in the secondary departments of St.Mark's School at Mbabane and the Evelyn Baring School at Goedgegun. Both are co-educational and have boarding establishments for boys and girls. St.Mark's was founded in 1908 as a Church of England school but was later established under independent control and registered as a profit-making company; in 1956 it was acquired by the Government. The Evelyn Baring School is a large central school maintained by the Government. In addition to these two schools, junior secondary education is provided at the Dominican convent, a girls' school founded at Bremersdorp in 1921.

At all government schools tuition, textbooks and stationery are free except that pupils in the secondary classes are required to pay for their English and Afrikaans 'set books'. Boarding fees may be remitted in whole or in part in necessitous cases.

Eurafrican education. Lower secondary education is provided at three of the four grant-aided mission schools for Eurafricans. Tuition is free and government grants make possible the issue, free of charge, of essential textbooks and stationery. Boarding fees range from £12 to £20 per annum and a large number of boarding bursaries are granted annually by the Department. Eurafrican pupils sometimes attend the African trades school at Mbabane.

TYPES OF SECONDARY EDUCATION

General secondary schools. Entrants to African secondary schools are required to have passed high enough to be awarded a continuation certificate in the external examination taken at the end of primary standard 6. The classes in the 3-year junior secondary course are designated standard 7, standard 8 and Junior Certificate, and in the 2-year upper cycle Matriculation 1 and Matriculation 2. The curriculum comprises English, Zulu, Latin, mathematics, arithmetic (to Junior Certificate), physical science, biology and geography, with book-keeping, typing and shorthand as optional subjects. Teachers are, as far as possible, African university graduates, supplemented by European teachers for certain subjects. Numbers of pupils leave after standard 7 to enter vocational training centres (usually teaching, nursing and trade training). For this reason, and also because standard 7 is in reality no more than an introduction to secondary education proper, the Department conducts an external examination at the end of that year. Successful pupils are awarded either a continuation certificate, which entitles the holders to proceed to standard 8, or a leaving certificate. Pupils who continue with the general secondary course are prepared for the Junior Certificate and Matriculation examinations of the Joint Matriculation Board of the University of South Africa. A pass in the Junior Certificate examination is required for entrance to certain levels of vocational training and the upper secondary course. On the results of the final external examination two kinds of certificate are awarded, Matriculation or the School Leaving Certificate. The former admits holders to the Pius XII University in Basutoland or to a post-matriculation centre in Southern Rhodesia which prepares students for entry to the University College of Rhodesia and Nyasaland.

European and Eurafrican secondary schools also prepare for the South African Joint Matriculation Board examinations but the full course lasts only 4 years, the Junior Certificate being taken at the end of the second year. The curriculum comprises English, Afrikaans, Latin, mathematics, physical science, arithmetic and geography, with agricultural science, domestic science and book-keeping as options. Teachers are recruited in the Union of South Africa or the United Kingdom. For higher education most secondary leavers go to institutions in the Union.

Technical and vocational schools. The Mbabane Trades School, with a staff of seven instructors, offers 4-year courses in general building, carpentry and cabinet making (entry post-standard 6), and motor mechanics (entry post-standard 7). The students, who are mainly African but include a few Eurafricans, obtain practical experience through erecting classrooms at government schools, providing furniture for schools and offices, and doing maintenance and repair work on government and private vehicles. A furniture factory, equipped with modern machinery, is attached to the school as a 'production department'. School leavers have had no difficulty in finding employment.

The housecraft training centres (one African and one Eurafrican) offer a 2-year course in dressmaking, cookery, upholstery and general housekeeping. The aim is to equip girls with the knowledge and skills needed to run a home efficiently and economically. The African centre also trains domestic science teachers.

The Department of Land Utilization conducts a one-year

course in elementary veterinary science and animal husbandry for African cattle guards, and a one-year course in elementary agriculture and soil conservation for African Land Utilization Officers.

The training of African nurses and midwives is conducted at a nursing school attached to the Bremersdorp hospital and coming under the Director of Medical Services. Courses are at three levels: a 4½-year course, post-Junior Certificate, leading to the High Commission Territories Nursing Council Certificate; the 4-year course, post standard 6, of the Swaziland Executive Nursing Committee; and a 2-year nurse-aid course, post-standard 6, leading to Red Cross certificates in first aid, home nursing and infant welfare.

No technical or vocational education is available for Europeans.

Teacher training schools. Teacher training courses for Africans exist at two levels: a post-standard 6 course, conducted at the Nazarene school only, for teachers in elementary vernacular schools (i.e. up to standard 2), and a post-standard 7 course for teachers in lower primary schools (i.e. up to standard 4). For higher primary teaching a number of students are trained in Basutoland, the entrance qualification being Junior Certificate.

There are no teacher training facilities for Europeans or Eurafricans.

Out-of-class activities. Organized sports and team games are included in the activities of all secondary schools, netball and association football being particularly popular with the Africans, and cricket, rugby, hockey and tennis with non-Africans. Annual athletic competitions are held.

TRENDS AND PROBLEMS

The recent expansion of secondary education in Swaziland has already been mentioned. The trend continues, impelled by the rapid increase in the number of primary schools and the consequent pressure of primary leavers on secondary institutions. One result affecting the latter has been a recent review of teacher training arrangements and a plan for their extension. A big problem in secondary education of all types and for all races is the recruitment of a sufficient number of qualified staff. Improvements in the salaries and status of African and Eurafrican teachers, initiated in 1957, have already relieved the position to some extent but it is always difficult to obtain European staff, who must be sought in the Union of South Africa and the United Kingdom.

There has been a remarkable change in recent years in the attitude of Africans to vocational and technical training. The trades school opened with two instructors and one pupil; today the demands for admission exceed the accommodation available, although the school was considerably enlarged in 1957. There has been a parallel if somewhat smaller increase in the demand for domestic training for girls.

[*Text revised by the Resident Commissioner, Mbabane, in December 1959.*]

Population (mid-year 1958 estimate): 267,000.
Area: 6,704 square miles; 17,363 square kilometres.
Population density: 40 per square mile; 15 per square kilometre.

Summary of school statistics, 1953–57. In 1957 enrolment in all schools totalled over 28,000 pupils, representing about 11 per cent of the population. Of the total enrolment, 97 per cent were pupils in primary schools, 2.5 per cent in general secondary schools and 0.5 per cent in vocational and teacher training schools.

In the primary schools 92 per cent of the pupils were Africans, and the proportion of girls 51 per cent in 1957 against 53 per cent in 1953. The number of primary school teachers was over 780 in 1957, an increase of about 50 per cent over 1953. The average pupil teacher ratio in primary schools was 35 in 1957.

Total enrolment in general secondary schools increased by 44 per cent between 1953 and 1957 and the number of girls enrolled by 35 per cent over the same period. African pupils represented 74 per cent of total enrolment, Europeans 20 per cent and Coloured pupils 6 per cent respectively. In vocational schools, enrolment of Africans and Eurafricans increased by 41 per cent between 1953 and 1957. The number of Africans training to be teachers in 1957 was 70, of whom 43 were women. The pupil-teacher ratio in all

secondary schools including teacher training was 11 in 1957 compared with 19 in 1953. (See Table 2.)

Examination results in secondary education, 1953–57. Sixty-five pupils were awarded junior secondary certificates in 1957 and the number who matriculated was 6. In the same year 25 Africans passed the lower primary teacher training certificate and 5 the elementary vernacular teaching certificate; in addition 6 students successfully entered for the higher primary teacher training certificate in Basutoland.

Educational finance, 1957. Total expenditure on education in the fiscal year beginning January 1957 amounted to 235,573 pounds sterling or approximately £0.9 per inhabitant. Of the amount spent, 68 per cent (£160,958) was contributed by the Central Government from territorial revenue, 14 per cent (£32,196) came from United Kingdom funds, 9 per cent (£20,269) from local authorities and 9 per cent (£22,150) from voluntary agencies. Capital expenditure (£45,692) was 19 per cent of the total. The distribution of recurring expenditure by level and type of education is given in Table 1.

2. African education only, including teaching staff for the vocational and teacher training schools.
3. Included in secondary general education.

CAMEROONS

Trust Territory

The Territory is administered as an integral part of the Federation of Nigeria. In education the Southern Cameroons has considerable autonomy, with an education department under a Chief Education Officer who is generally supervised by the Chief Federal Adviser on Education in Nigeria. The Northern Cameroons forms part of the Northern Region and the educational system therefore falls directly under the Minister of Education of that region.

Details of the school system and statistics are included in the chapter on the Federation of Nigeria.

STATISTICS

Population (mid-year 1958 estimate): 1,591,000.
Area: 34,081 square miles; 88,270 square kilometres.
Population density: 47 per square mile; 18 per square kilometre.

Educational statistics are included in those given for the Federation of Nigeria on pages 1266–68.

GAMBIA

THE EDUCATIONAL SYSTEM

The territory of the Gambia comprises an area known as the Colony (30 square miles) and a much larger hinterland (4,000 square miles) known as the Protectorate. As regards education, there is a marked contrast between the two areas; some 70 per cent of the total school population are drawn from the Colony. In the Protectorate, conditions are overwhelmingly rural, and owing to the nature and shape of this part of the territory it is not easy for people, news or ideas to circulate.

The Education Ordinance and Regulations which came into force on 1 January 1947 remain the main legal basis of the school system. Education is not compulsory. The ordinance provides for a Board of Education, representative of the education authorities, the Legislative Council, the Missions, the Muslim community and the Protectorate, to advise the Governor on educational policy. Education in the Protectorate is surveyed each year at the Conference of Chiefs.

The administration of education is in the hands of a Director of Education, assisted by education officers in charge of the Colony area and the Protectorate. Teacher training is also the responsibility of the Education Department. In Bathurst (the capital) and the rest of the Colony, schools are classified as government, local agreement, aided or unaided schools. Local agreement schools are primary schools which were formerly run by missions but which were transferred to the Government under the Cox Agreement of 1946; the Government pays rent to the former owners and the schools are administered through management committees, on each of which the appropriate religious authority is represented. In the Protectorate most schools are owned and controlled by district authorities but there is a growing number of mission schools, usually aided.

The Director of Education is an *ex officio* member of the West African Examinations Council, which meets once a year. The Department is responsible in the Gambia for the conduct, on behalf of the Council, of the West African School Certificate and the external examinations of the University of London.

In the Colony the educational ladder begins with a 3-year infant school, which receives pupils at the age of 5. This is followed by a 4-year basic primary course (standards 1 to 4), leading to education in 6-year schools of a secondary grammar type, or a 3-year secondary modern school, or senior primary classes (standards 5 to 7). There is so far no provision for further education, but several students

proceed to teacher training. Students requiring higher education go abroad, usually to the United Kingdom; assistance is available in the form of government scholarships and bursaries. Other government departments provide a variety of awards for advanced technical and professional training. The language of instruction in all schools is mainly English, although the vernacular is often used in the first year.

In the Protectorate there are no infant schools but the basic primary course was extended in 1959 to six years. There is only one post-primary school. Otherwise Protectorate children go to Colony schools for secondary education.

THE DEVELOPMENT OF SECONDARY EDUCATION

Until quite recently all secondary education in the Colony (as distinct from senior primary schooling) was being provided by the Methodist and Roman Catholic missions. The first record of a Methodist secondary school is in 1876. By 1950 each mission was running two secondary schools—one for boys and one for girls. For the teaching of sciences, pupils from all secondary schools attended classes at the Bathurst School of Science, founded in 1949 by the Government and the missions as a joint enterprise. In 1951 the Baldwin Report, covering the whole field of education, recommended the establishment of one independent, co-educational, non-denominational secondary school for the territory. In a White Paper entitled 'Government Statement on Secondary Education', published in 1956, the Government accepted this recommendation. The Methodist Mission agreed to co-operate in the founding of the school, which was established by Ordinance No. 3 of 1958 and began functioning in January 1959 as the Gambia High School. The new school incorporates the two Methodist high schools and the science school and is administered by an independent board of governors.

To make better provision for non-academic secondary education, the Government in 1958 opened a new secondary modern school at Crab Island, the building being provided from the Colonial Development and Welfare Fund. This school has brought together in one institution all the senior primary classes in Bathurst, with the exception of those in Roman Catholic schools.

The only post-primary school in the Protectorate is Armitage School, founded in 1927 as a boarding school originally for the sons of chiefs. Latterly it has provided a 5-year post-primary course; selection is made from all boys completing standard 4 in protectorate schools. It is now being rebuilt to admit a larger number of pupils and reorganized as a two-stream post-primary school offering a 4-year course.

In the Colony, evening classes in commercial subjects began in 1944 and were reorganized as the Government Clerical School in 1949. The Technical School began to function in 1950. Prior to 1949 teachers received their training in Sierra Leone or at courses held at regular intervals in Bathurst. In that year a teacher training centre was opened at Georgetown in the Protectorate; in 1952 the centre was transferred to Yundum, near Bathurst, and became the Teacher Training College, a residential institution.

All secondary schools charge fees but a number of scholarships are available. Teachers in government schools are civil servants and enjoy full pension rights. Staff salaries in the mission secondary schools are reimbursed by the Government; the missions also receive the fee income of £6 per pupil, less 25 per cent which is paid to the Government. The well-being of school children is the concern of a social welfare officer. All school children in the Colony undergo medical and dental inspection; for those in the Protectorate this is carried out when staff is available.

TYPES OF SECONDARY EDUCATION

Schools of the secondary grammar type set their own entrance examinations and select pupils from standard 4 in both Colony and Protectorate. In addition they accept pupils who have passed the Government Standard 4 Scholarship examination. The schools follow a 6-year course and are recognized for the award of the West African School Certificate. The curriculum is determined largely by the requirements of the certificate. The subjects taught include English language and literature, history, geography, Latin, French, Bible knowledge, mathematics, biology and health. Biology is the only science subject, and religious knowledge is taken by both Christian and Muslim pupils.

Pupils who do not gain admittance to the secondary grammar type of school go to the three-year secondary modern school or remain in their primary schools for a further three years to standard 7. In both cases they then take the Government School Leaving examination. The new secondary modern school provides good facilities for arts and crafts and domestic science.

The Technical School in Bathurst gives artisan training for carpenters and joiners, and for masons. Apprentices follow a 4- to 5-year course and are recruited from the senior forms of primary schools. Courses in motor-fitting and metalwork are to be started when staff can be recruited. Technical instruction is also given to probationers and trainees in the Agricultural, Medical, Printing, Public Works, Marine Dockyard, and other government departments.

The Government Clerical School gives instruction in typing, shorthand and book-keeping. Two courses are admitted during the year: the main course is intended for clerks who have passed the Government Entrance examination and lasts six months; the subsidiary course is for clerical assistants and is for a shorter period. Students also receive instruction in English, arithmetic and civics, and attend lectures given by heads of departments on the functions of government.

The minimum qualification for entry to the training college is completion of standard 7. The course is for men and women students and lasts 3 years. The curriculum stresses training in the teaching of primary school subjects, including English, handwriting, art, subjects of rural interest, the use of prescribed textbooks and project work with groups.

Out-of-class activities in the various secondary schools include team games, particularly football and cricket, athletic sports, Boy Scouts and Girl Guides.

TRENDS AND PROBLEMS

At present about 30 per cent of the pupils who reach standard 4 are accepted for entry into secondary grammar schools. The provision of this type of secondary education is thus adequate for the time being, and it is hoped that the quality will improve with the establishment of the Gambia High School. There is so far no provision for post-certificate (sixth form) work, but it is hoped that this will soon be remedied.

The new secondary modern school can admit 180 pupils each year, and is large enough to absorb the intake of standard 4 pupils until 1960: thereafter these numbers increase steeply, and it will be necessary either to limit entry or to institute double sessions.

New schools are being built as resources permit; but the demand for education is rapidly outstripping the capacity to finance it.

STATISTICS

Population (mid-year 1958 estimate): 292,000.
Area: 4,003 square miles; 10,369 square kilometres.
Population density: 73 per square mile; 28 per square kilometre.

Summary of school statistics, 1953–57. In 1957 total enrolment in 54 institutions at primary and secondary levels was 6,626 pupils representing just over 2 per cent of the total estimated population. Nearly 89 per cent of total enrolment was in primary schools, about 10 per cent in general secondary and the remaining pupils were divided between vocational and teacher training courses. In 1957 the proportion of girls was 26 per cent in primary schools (against 20 per cent in 1953); 13 per cent in general secondary schools, 7 per cent in technical and 42 per cent in secondary teacher training schools. The number of primary school teachers increased by 29 per cent between 1953 and 1957 and women were over half the total teaching staff. Enrolment in primary schools increased by 38 per cent over the period under review and in general secondary schools by 14 per cent. The pupil-teacher ratio in primary schools was 29 in 1957 and in general secondary schools 17. (See Table 2.)

Examination results in secondary education, 1953–57. There has been no increase in the number of candidates passing the West African School Certificate and the General Certificate of Education over the past three years. Fourteen boys and 4 girls succeeded in the former examination in 1957/58 compared with 17 boys and 4 girls in 1955/56. In the General Certificate of Education there were 19 successful candidates in 1957/58 compared with 26 in 1955/56.

Educational finance, 1958. Total expenditure on education in the fiscal year beginning January 1958 was 180,851 West African pounds or about £0.6 per inhabitant. Of this sum 77 per cent (£138,749) was contributed by the Central Government from territorial sources, 12 per cent (£21,612) came from United Kingdom funds, 6 per cent (£10,950) from local authorities and 5 per cent (£9,540) from voluntary agencies. Capital expenditure (£45,256) was 25 per cent of the total. The distribution of recurring expenditure by level and type of education is given in Table 1.

FEDERATION OF NIGERIA

THE EDUCATIONAL SYSTEM

The first education ordinance was enacted in 1882, when the Colony of Lagos was united to Gold Coast Colony. Rapidly changing conditions in the early part of the twentieth century were stabilized by the Codes of 1926 (Ordinance No. 14 of 1926, referring to the Northern Provinces and No. 15 to the Southern Provinces), which remained in force virtually untouched until after World War II. In 1945 a 10-year plan was formulated and after an investigation on grants-in-aid had been made the 1948 Ordinance was enacted and the present educational system may be said to have come into being.

Constitutional changes made it necessary to re-enact the 1948 Ordinance in 1952 to make it applicable to the newly established Regions, and the Adaptation of Laws Ordinance in 1954, when Nigeria became a Federation, provided for the devolution of the functions of the Central Authority on Regional Directors and Regional Boards.

Legislation thereafter developed regionally and although at first the main provisions of the 1948 Ordinance were retained, later ordinances introduced significant changes. The essential framework remains the same, but it will be necessary to consider the Regions separately to show what divergences have occurred.

All the education ordinances in force today control the provision of primary and secondary education, but not of higher education, which is the subject of separate ordinances. Secondary education includes the secondary grammar, secondary modern, secondary commercial, technical and vocational, and teacher training types of education. Regulations are framed to control the opening of schools, the conduct of schools, the registration and salaries of teachers and the payment of grants-in-aid. As a rule, no

conditions of entry to schools refer to religion, nationality, race or language. Religious instruction must be included in the curriculum but pupils are not obliged to attend classes. Instruction is normally in the vernacular or English or both.

In all Regions schools are controlled by the Regional Government or by the local education authority, or by the missions and other non-government bodies (known as voluntary agencies), or by private individuals. The majority of schools are either voluntary agency or local authority schools.

Lagos

The Education Ordinance in force today is No. 26 of 1957, together with some later amendments. It provides for free primary education. Most schools are voluntary agency, but one primary school, two secondary schools (which, although situated in the federal capital, serve the entire Federation), a teacher training college, the technical institute and the trade centre are government schools and are not controlled by grants-in-aid regulations.

Southern Cameroons

The 1952 Ordinance, as adapted in 1954, remains in force. The majority of schools are voluntary agency, but not all are assisted.

Eastern Region

The 1952 Ordinance, as adapted in 1954, was replaced by No. 28 of 1956, which provided for a purely regional system of education based on ministerial organization. Later amendments to the grants-in-aid regulations enabled the introduction of free primary education. Schools are controlled mainly by voluntary agencies and local authorities.

Northern Region

Ordinance No. 17 of 1956 replaced the 1952 Ordinance. It did not provide for the introduction of free primary education. Voluntary agencies and native authorities (which are included here in the term 'local authority') control most of the schools in the Northern Region.

Western Region

In 1955 an Ordinance (No. 6) was enacted which departed very considerably from its predecessor. It provided for free primary education and laid down new regulations governing the administration and organization of the school system. Local education authorities, when established, were made responsible for primary and secondary modern schools. As in the Eastern Region, by far the greater number of schools in the West are controlled by voluntary agencies or local authorities.

Role of public authorities

Central Government. The Federal Government, through the Ministry of Education and Education Department, controls primary and secondary education in Lagos. It has executive control over the two government secondary grammar schools, the technical institute and the trade centre.

With respect to the Regions, the functions of the Central Government are advisory. Inspections of schools and colleges are undertaken on request, and assistance is given with practical teaching tests. Committees have been set up on which professional representatives of the Federal Education Department and the Regions sit to discuss educational matters of common interest and to pass resolutions which, though they have no legal force, nevertheless carry considerable weight. The University College, the Nigerian College of Technology and the Nigerian Union of Teachers are also members of the main Joint Consultative Committee. Both the Ministry and the Department are concerned with the two institutions of higher education, University College, Ibadan, and the Nigerian College of Arts, Science and Technology; these two institutions are federal.

Regional governments. With the exception of Southern Cameroons, the staff of whose Education Department at present comes under the control of the Federal Education Office, all the Regions are completely independent with regard to education.

Regional governments control all education, except higher education, through the ordinances referred to above, and provide the necessary administration. Curricula and syllabuses in primary schools and teacher training colleges are also controlled.

Since 1954 the organization has been on a ministerial basis, and the Educational Departments which at first existed separately are now incorporated in the Ministries of Education.

Regional governments directly maintain and control a small number of schools (mainly post-primary), make grants to the voluntary agencies and local authorities, the payment of which is governed by grants-in-aid regulations, and provide for the inspection of schools.

Local governments. All the education ordinances in force today provide for the setting up of local education authorities and local education committees. These, together with native authorities, perform the function of local government in education.

As a general rule, they have the power to levy rates and they are responsible for most types of primary and secondary education to a degree which varies considerably from Region to Region. For example, in the West the local authorities have complete control, subject to the provisions of the law, of primary and secondary modern schools.

The part played by local authorities in education has increased rapidly during the last few years and it seems likely that it will continue to increase.

Role of private agencies

Private agencies are known as voluntary agencies. They include a considerable number of missions and religious societies, business houses and private individuals. The larger missions have an organization comparable with that of a government department or ministry, and control, as proprietors and managers, a large proportion of the primary

schools, secondary grammar schools and teacher training colleges in the country. Until the post-World War II period the voluntary agencies were responsible for the greater part of educational development, particularly in the South. The initiative in the acquiring of lands and buildings and the opening of schools lay with them.

Today, the Government assists the approved voluntary agencies by making grants-in-aid for salaries, running expenses and for building purposes.

However, by no means all voluntary agency schools receive assistance. In the West, theoretically, no educational institution is unaided, and in the East unaided are comparatively few, but in the North there is a considerable number of unaided primary schools.

Structure of the school system.

This is shown in the diagram on page 1259.

A description of the educational system today is not complete without reference to education outside institutions and outside the Ministries of Education. Adult education, mainly concerned with literacy and welfare for both men and women, is under the aegis of the regional governments and local authorities. Other government departments such as Forestry, Veterinary, and Posts and Telegraphs, the corporations, and several of the larger business houses run their own training courses, which are largely technical.

In the Northern Region there are a large number of Muslim schools where religious instruction and training in the elementary laws of social behaviour are given. They are not schools in the strict sense of the word, being rather gatherings of young boys (with a few girls occasionally) at certain places for instruction by the *mu'allim* (teacher).

THE DEVELOPMENT OF SECONDARY EDUCATION

At the beginning of the twentieth century a few secondary grammar schools and teacher training colleges were in existence, all in the southern part of Nigeria, where the various Christian missions first operated. Government assistance was limited to four secondary schools.

The 1908 Code provided for greater assistance to secondary education and in 1909 the first government secondary school (King's College in Lagos) was opened.

In 1914 Southern and Northern Nigeria were amalgamated and Lord Lugard, the Governor-General, formulated a general policy for education which resulted in the Code of 1916. The object was to increase assistance to the voluntary agencies.

The 1926 Ordinance provided for greater control by the Education Departments and a system of grants-in-aid based on salaries paid to teachers. The Government came into the picture by establishing further secondary schools and introducing elementary training centres for teachers. During the period 1914–29 most development went on in the South but in 1921, in the North, a teacher training college was opened at Katsina, and a number of post-primary schools (12 in 1929), described as 'central', came into being. These schools very soon acquired the name 'middle' and both South and North Education Departments used the term synonymously with secondary. This was eventually to cause a great deal of confusion as in a full 6-year middle school course the first 2 years corresponded to the last 2 of the primary course, and years 3–6 corresponded to the first 4 of the secondary course. The middle schools of the North were financed largely by Native Administrations and were known as 'NA' schools.

In 1929 the Northern and Southern Education Departments were amalgamated, by amendment of the 1926 Ordinances, and considerable expansion followed. Immediately prior to World War II there were 30 non-government and 4 government (including 1 for girls) secondary schools in the South and 1 government secondary school and 10 NA middle schools in the North. Both the government and voluntary agency teacher training colleges had increased in number considerably.

The year 1932 saw the establishment of a Higher College at Yaba, near Lagos. The significance of this to secondary education was that for the first time courses in technical subjects appeared in an education department institution.

After a period of stagnation or recession in the early part of World War II, education in Nigeria began to move forward again and in 1945 a 10-year development plan (Sessional paper No. 24) was published. It referred specifically to secondary schools, teacher training colleges and technical education, and was followed up by an investigation on grants-in-aid by S. Phillipson and W. E. Holt, and by the 1948 Ordinance.

Since 1948 the number of secondary grammar schools has rapidly increased; the West has developed secondary modern schools on a large scale and the North has converted its middle schools to provincial secondary schools. Teacher training colleges also increased in number and settled down into two main categories—elementary (Grade III) and higher elementary (Grade II).

The 1945 scheme for technical education was put into operation almost immediately and was assisted by Colonial Development and Welfare funds. Higher College, Yaba, was converted into a technical institute and further technical institutes were established at Kaduna and Enugu. Trade centres and handicraft centres have been developed throughout the Federation.

The development of secondary education has been closely bound up with that of primary education, and not until the 10-year plan of 1945 did it attract undivided attention. Even then, it did not become the subject of a separate ordinance. The main events in the history of secondary education are, therefore, also the main events in the history of education generally until the last few years when free primary education was introduced in the East, Lagos and the West.

Legal basis

There are no ordinances referring to secondary education alone, except those that provide for the establishment of certain government schools. The laws and regulations governing secondary education are embodied in the education ordinances referred to above.

Administration

In each Region and in the Federal Territory the Minister is responsible for administration. He is advised by boards

of education in the Regions, and in Lagos by the Chief Federal Adviser acting for a local education authority to be appointed. The boards, which consist of representatives of all parties interested in education, are responsible for planning and policy, as they were before 1954. However, the professional sides of the Ministries, corresponding to the original education departments, provide expert advice to the boards from the heads of the sections responsible for secondary education.

Control. Except in Lagos, the central education authority does not control secondary education. Regional Ministries control secondary education in their own regions. The details of nomenclature and structure vary considerably from region to region but the essential framework remains the same. At headquarters there will be administrative officers responsible for secondary education (general), secondary education (technical), and teacher training. This does not apply to Southern Cameroons and Lagos, where the organizations are too small to permit this sub-division.

The government secondary grammar schools are usually controlled direct from headquarters. Voluntary agency grammar schools are controlled by boards of governors which consist of representatives of the agencies and of the Government (including members of the Ministries of Education), and are responsible to their regional headquarters.

Secondary modern schools in the West are controlled by local education authorities, and provincial secondary schools in the North by boards of governors or advisory councils responsible initially to the Native Administrations and Provincial Education Officers. Government officers are posted by the Northern Regional Government to these schools to assist with staffing.

Technical institutes and trade centres are controlled direct from headquarters.

Teacher training colleges may be government, local education authority (or Native Administration), or voluntary agency. Government teacher training colleges are controlled by headquarters, and other training colleges are controlled locally. As a general rule the voluntary agency colleges have boards of governors, boards of trustees, or managers, responsible to regional headquarters.

There is virtually no control over unassisted institutions except that they can be closed if they do not conform to regulation requirements.

Government control over the voluntary agency secondary schools is largely financial, but over teacher training colleges it is much greater since syllabuses and examinations are a government responsibility.

There is some liaison between the technical education organizations of corporations, business houses, and certain other Ministries, and the technical sections of the Ministries of Education.

Supervision and inspection. The East, North and West each have an inspectorate branch or section. There is no inspectorate yet in the Southern Cameroons or in Lagos but the advisory staff of the Federal Ministry of Education perform the function of an inspectorate on request.

In the three regions mentioned above, the organization of the inspectorate varies considerably. In the West there are staff inspectors in charge of secondary education, teacher training, etc., at headquarters, and inspectors and assistants in the Provinces. In the North a senior inspector (secondary) and a senior inspector (teacher training) are in charge at headquarters, and regional inspectors in the Provinces. In the East there are inspectors for teacher training, and secondary and technical education at headquarters. Each region has a chief inspector.

The organization in the West permits fairly regular visits and inspections but elsewhere special arrangements have

GLOSSARY

'*bridge course*': 1-year course for Grade IV teachers in Northern Region and some experienced uncertificated teachers before entry to Grade III training colleges.

emergency training scheme (science): 2-year post-School Certificate course in science subjects only, leading to General Certificate of Education (Advanced level).

junior secondary: three schools in the Northern Region with 2-year secondary grammar course.

modern classes: 2-year post-primary course with strong practical bias.

preliminary teacher training: preliminary course before entering Grade III teacher training colleges.

primary: the first 6, 7 or 8 years of education, the length of course varying from region to region. The terms used on the diagram indicating various stages and names of classes are self-explanatory.

secondary 'grammar': secondary schools with 5- or 6-year courses leading to School Certificate. Strong academic bias. Includes *provincial secondary schools* in Northern Region with higher practical content.

secondary commercial: secondary schools with courses in commercial subjects.

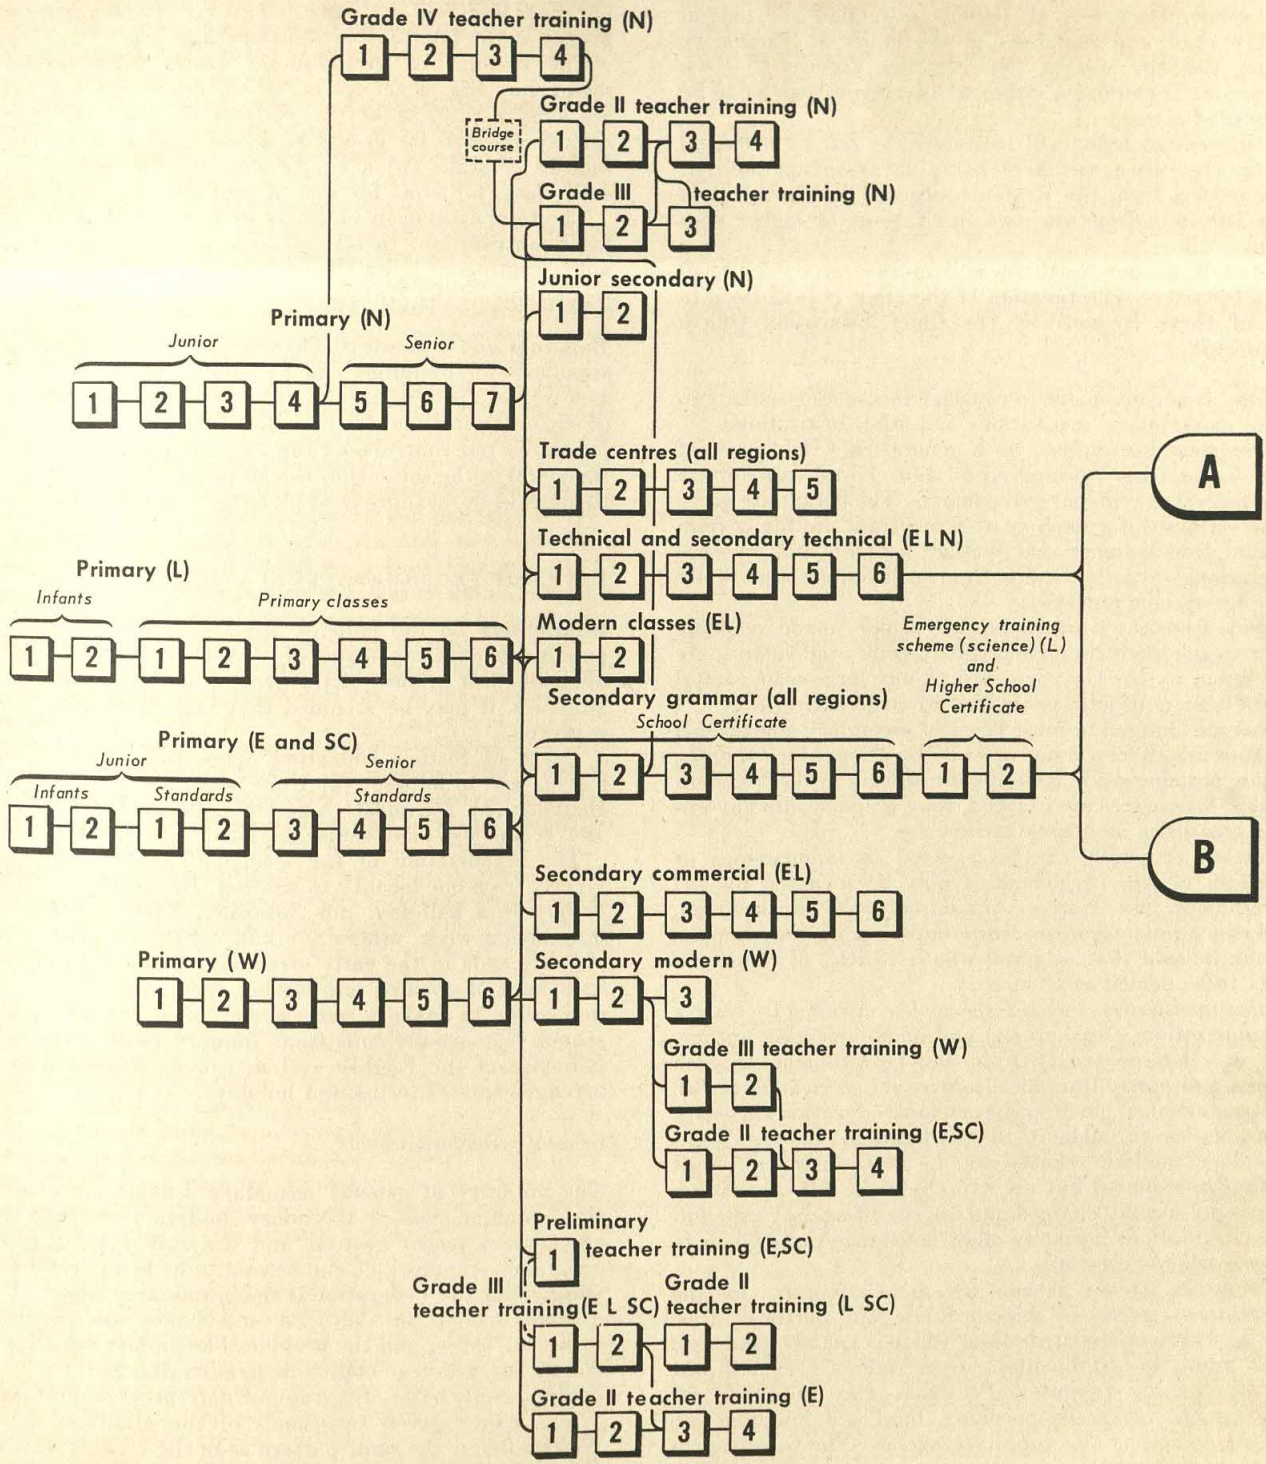
secondary modern: schools in Western Region with 3-year post-primary courses with strong practical bias.

secondary technical: secondary departments of technical institutes.

teacher training: courses of varying length and difficulty leading to Teacher's Certificate.

Grade IV: 4-year course after 4th primary class in Northern Region; previously known as *vernacular training course.*

Grade III: 2- or 3-year course leading to Teacher's Elementary (Grade III) Certificate.



Grade II: 4-year course for entrants who have completed their primary education (Eastern Region) or completed class 2 secondary modern) Western Region) or class 2 secondary grammar (Northern Region); 2-year course for entrants with Grade III Certificates or who have completed the 5- or 6-year secondary grammar course. Both courses lead to Teacher's Higher Elementary (Grade II) Certificate.

technical: full-time and part-time courses at technical institutes in Eastern and Northern Regions and Lagos, principally in engineering and commercial subjects. Courses vary in length with the subject.

trade centre: courses for training in trades such as cabinet making, plumbing, painting and decorating.

to be made. However, all regions call upon the federal advisory staff and members of the staffs at University College, Ibadan, and of the Nigerian College of Arts, Science and Technology, either to lead inspections or to be members of a team.

An inspecting team will frequently be led by a federal adviser, the other members being an assistant adviser, senior officers from the Region concerned and lecturers or senior lecturers from the two institutions of higher education.

In the West and North there is no inspector (technical) at headquarters. The function of the office is performed in each of these Regions by the Chief Education Officer (Technical).

Finance. It is convenient to consider this section under two heads—government institutions and other institutions.

Government institutions. As a general rule the source of funds for salaries, running costs, and capital expenditure is the federal or regional governments. The details are given in the estimates for each year. Exceptions are funds from Colonial Development and Welfare sources, and overseas foundations or trusts. Grants from such sources are usually made for specific purposes.

Funds from the Government are usually made available direct to the institution concerned. Senior staff salaries are paid direct by the Government and any large-scale capital expenditure is usually controlled by headquarters.

Fees are charged in most types of secondary educational institutions. There are one or two exceptions; for example, fees are not charged in government colleges in the Northern Region. Where fees are charged, they are paid into government treasuries, and rank as revenue.

Parents of pupils can be assisted by scholarships or remission of fees. Scholarships may be awarded by the Government, by Native Administrations (Authorities), local education authorities, corporations or business houses. It may be said that no pupil who is worthy of support is likely to be denied assistance.

Other institutions. Funds for schools controlled by Native Administrations (Authorities) and local education authorities are derived partly from the Government of each Region and partly from local sources (i.e. education rates). The proportion of government and local education authority funds varies throughout the Federation. In the West, secondary modern schools are, in most instances, built by the Government but are expected to be self-supporting.

Fees are usually charged and are set off against expenditure. Regulations normally allow assistance to be given to parents where necessary.

Voluntary agency schools are financed partly by the Government, partly by mission funds, and partly by fees. The government's contribution, which is usually paid as a block grant (in instalments), covers staff salaries and part of the running expenses. Provision may be made for building but, generally speaking, land and buildings are already owned by the voluntary agency. The Government has the power to make special purposes grants for buildings and of recent years this power has been used to expand and improve existing buildings.

Fees are charged and are regarded as revenue by the institution concerned. Tuition fees swell the general income, but boarding fees are expected to cover the running expenses of the boarding establishments.

The systems of grants-in-aid varies from region to region but the principles on which grants are calculated are similar throughout the Federation. An institution is usually assessed for grants as follows: (a) a sum equal to salaries of staff; (b) a capitation sum for each pupil or each class; (c) sums for special purposes, e.g. buildings.

The total capitation sum may be reduced by an assumed local contribution. In all cases the payment of grants-in-aid is contingent upon the institution's conforming to the regulations of the Ministry or authority concerned.

Buildings and equipment. There are no generally accepted standards for buildings and equipment in the Federation as a whole. The Ordinances which form the statutory basis of education include clauses which refer to minimum space for pupils, but control over the size and quality of buildings is general in the sense that the Ministry reserves the power to approve or disapprove of plans for new buildings.

TYPES OF SECONDARY EDUCATION

Information on the help or direction given to pupils or parents in choosing types of secondary education is not available, but in view of the general absence of vocational guidance, it may be assumed that little help of this kind is given.

Types of further education open to secondary school leavers are as follows: (a) University (University College, Ibadan); (b) Technical: Nigerian College of Arts, Science and Technology; and senior sections of technical institutes.

The organization of the secondary school year varies greatly from one locality to another. In the Muslim North, Friday is a half-day, not Saturday. Some schools work five days a week, others five and a half. In most schools the day ends in the early afternoon. The length of terms and dates of opening and closing vary so much that it is impossible to make a general statement except that the school year usually runs from January to December. The influence of the English system can be discerned in the arrangements of terms and holidays.

General secondary schools

The majority of general secondary schools are either of the grammar type or secondary modern type. The latter are of very recent growth, and the only type of general secondary school which can be said to be firmly established throughout the Federation is the grammar school.[1]

Some schools in the East and Lagos are developing technical 'sides', and the provincial secondary school in the North has a 6-year course in handicrafts, but no schools could possibly be described as multilateral or comprehensive.

The names given to schools of the grammar type in Nigeria follow the same pattern as in the United Kingdom. Grammar, high, academy, secondary, college, are commonly used.

1. The term 'secondary school' is commonly used to refer to the 'grammar' type of school only.

Secondary grammar. The aim of the secondary grammar school is to provide a general education leading to School Certificate, and in some schools to Higher School Certificate, and to produce good citizens.

Pupils are selected by means of competitive examinations and interviews. The standard of these examinations varies considerably, and the only common factor that can be found is the setting of papers in English and arithmetic. Most voluntary agencies run their own examinations, a small number in the West and the two government colleges in Lagos take part in a Common Entrance examination conducted by the West African Examinations Council, and government colleges and other schools that wish to do so sit a Common Entrance examination in their own region.

The curricula of most grammar schools follow closely the lines of the traditional English grammar school. A survey made a few years ago showed that English language and literature, geography, history, mathematics and religious knowledge were common to very nearly all schools. Latin appeared in most, and the sciences in about half.

Domestic science was common to the majority of girls' schools, and music, handwork, art and the vernacular occurred in about half of all schools. Civics and health science were taught in the lower forms of about one-third of the schools. Physical training, either in the time-table or out of school hours, was carried on in most schools.

In a very few schools were found such subjects as agriculture, farming, technical drawing, French, and book-keeping.

A typical weekly time-table would consist of 35 periods of 40 or 45 minutes each. English language and literature would be very generously treated, particularly in the lower school, and would be followed by mathematics, languages, the sciences, the social studies, and other subjects.

The majority of schools either have a 5- or 6-year course leading to School Certificate, or are working towards such a course. Many newly established schools have not been in existence long enough to complete the course. A few schools have Higher School Certificate courses, comprising a further two years' study.

Promotion from one form to the next is usually decided on the results of an annual examination. Results are debated at staff meetings and doubtful cases are usually thoroughly examined before decisions are made.

Some schools promote more or less automatically up to two years before School Certificate when a weeding-out of pupils unlikely to pass this examination takes place.

It is common practice to make a report on a pupil at least once a year. Term reports are frequently made. The form of the report varies from a bare statement of marks and positions in the subjects of the curriculum to comprehensive documents giving comments by subject masters, form masters, house masters, and the principal.

The School Certificate examination referred to above is an examination conducted by the West African Examinations Council. It replaced the Cambridge Oversea School Certificate, and the greater part of it is still set and marked in the United Kingdom, where final awards are made. The Higher School Certificate examination is the Oversea Examination of Cambridge University.

The teaching staff of the grammar type school varies from untrained young men and women whose academic attainment may not be as high as School Certificate to fully trained graduates with honours degrees. In government colleges the percentage of graduates is usually high. These teachers are known as education officers, and are recruited locally or from overseas. Locally recruited officers are appointed by the Public Service Commission of each region, and officers from overseas are usually appointed by the Colonial Office acting for the Government concerned.

Voluntary agency schools are responsible for their own recruiting, which is usually conducted through representatives overseas for expatriate staff, and by whatever means are available for local staff. The percentage of graduates is much lower than in government colleges but varies considerably from school to school.

The staff of the provincial secondary schools in the Northern Region consists partly of education officers as above, and partly of Native Administration teachers of varying qualifications.

Taking the secondary grammar schools of the Federation as a whole, certainly not more than one-third of the teaching staff are graduates, not all of whom are trained. The remaining two-thirds are certificated (overseas qualification, Nigerian Grade I, II or III) or uncertificated.

Few facilities exist in Nigeria for the training of teachers specifically for secondary schools. University College, Ibadan, has a one-year post-graduate course and a College diploma course in education, and the Nigerian College of Arts, Science and Technology has a one-year professional course leading to the Teacher's Certificate of the College.

Junior secondary schools. There are three junior secondary schools in the Northern Region. They have a 2-year course on the same lines as those in the secondary grammar schools. Pupils pass from them to provincial secondary schools or other secondary schools with full courses. The middle school of the Northern Region was renamed junior secondary school and then provincial secondary school, and the three schools referred to above were not developed above form 2.

Secondary modern schools. Secondary modern schools were established in the Western Region in 1955. Recent information about developments in other regions is not available but statistics returned for 1957 do not include this type of school. In Lagos and the East are what are known as 'modern classes', the majority of which are attached to primary schools.

The secondary modern school provides a 3-year course and the modern classes a 2-year course, both terminating in a school-leaving examination.

The curriculum in Lagos includes English language and literature, arithmetic, geography, home economics, music, arts and crafts, and physical training, and the aim of the modern classes is to continue the work of the primary school with more emphasis on the practical side.

In the Western Region about two-thirds of the time-table is taken up by compulsory subjects—arithmetic or mathematics, English, the vernacular, history and civics, geography, religious knowledge, physical education, nature study or general science or hygiene, and about one-third by optional subjects—domestic science, needlework, agriculture or rural science, commerce and book-keeping,

woodwork and carpentry, arts and crafts, and music. The aim is to give a strong practical bias to the curriculum without making it strictly vocational.

At the end of the course pupils may sit the competitive examination for entry to the West Region Public Service, and if successful would enter the service as clerical assistants or the equivalent grade.

The majority of teachers in the secondary modern schools and modern classes are Grade II, i.e. holders of the Teachers' Higher Elementary (Grade II) Certificate. They are trained in training colleges in Nigeria. Untrained teachers on the staffs will almost certainly have completed a secondary school course before starting teaching.

Technical institutes. There are three technical institutes in the Federation, one in the North at Kaduna, one in the East at Enugu and one in Lagos at Yaba. The institutes at Lagos and Kaduna offer more varied courses than the institute at Enugu.

At the Yaba Technical Institute 4-year courses for juniors in engineering, commercial subjects and printing are available, and for seniors, courses in civil, electrical, mechanical and radio engineering. These latter courses are known as 'sandwich', i.e., students attend a full session at the institute, then work for 18 months 'in the field' and follow up with a second full session at the institute. There are also part-time day and evening courses in engineering, printing, building construction, art and design, and commercial subjects.

Students sit the internal examinations of the institute at the end of their courses and seniors also enter for the General Certificate of Education (Advanced level) of London University, and parts I and II of the major institutional examinations in the United Kingdom if they wish to do so. Juniors may sit the GCE (Ordinary level) of London University, and part-time students may enter for examinations of the Royal Society of Arts and the City and Guilds in the United Kingdom. The Technical Institute, Yaba, will take the West African School Certificate in future.

Entry to the junior courses is by examination (open to pupils holding the Primary School Leaving Certificate) and interview. Entrants to senior courses hold the School Certificate or its equivalent and are usually sponsored by an outside business house, corporation or government department.

Courses and conditions of entry at Kaduna are similar except that there are no part-time students, and the junior courses are for technical assistants in engineering and for commercial subjects. The secondary technical school, previously part of the institute, is now within the general secondary section of the Ministry of Education. Its curriculum is similar to those of the grammar schools, with a technical bias.

Courses at Enugu are limited to junior, as at Yaba, and senior sandwich engineering courses.

The teaching staffs at technical institutes are very largely recruited from overseas, principally from the United Kingdom. They include graduates (with or without training), and non-graduates with qualifications such as the Ministry of Education Certificate, Higher or Ordinary National Certificate, and Final City and Guilds Certificate of the United Kingdom.

Trade centres. The courses at trade centres, of which there is at least one in each region, are all trade training, the length depending on the particular trade and varying from five years for fitter/machinists to two and a half years for painters and decorators. The number of courses varies from one trade centre to another.

Entry is from the primary school, by examination and interview.

The staff at trade centres consists principally of holders of Final City and Guilds Certificates and Higher National Certificates, or skilled artisans who have passed through approved apprenticeships in the United Kingdom. The majority are recruited from the United Kingdom.

Secondary commercial schools. Commercial schools exist in all regions. Many of them are unrecognized and nearly all are private concerns. A number are recognized in the Eastern Region and one school in Lagos is assisted.

Courses include general subjects, shorthand and typing, and students enter for examinations of the Royal Society of Arts in the United Kingdom. In the East, successes have been very few indeed. Detailed information of staff is not available but it appears that most teachers are untrained, and the best will have Royal Society of Arts Advanced Level Certificates.

Training schools of ministries, corporations, business houses. The information available on these is very limited.

As a general rule there are schools of agriculture and forestry attached to appropriate ministries, and courses in veterinary education, clerical training, administration and other specialized subjects. Federal Posts and Telegraphs have a training school, the Nigerianization Office administers an Emergency Training Scheme (Science) and a Training Centre, and Civil Aviation has training schools. The corporations, e.g. Railway, and Broadcasting, and some of the larger business houses, run their own training schemes. It is not certain that all of the courses can be described as secondary.

The Ibadan School of Forestry serves Forest Departments (or appropriate sections of ministries) of all regions. Entrance requirements are normally School Certificate or its equivalent. Courses are practical and include botany, geography, geology, surveying and map-making, introductory forestry, and forest engineering.

The Emergency Training Scheme (Science) was begun in Lagos in 1958, to meet the need for graduates in engineering and the sciences. The object is to produce students with qualifications giving them entry to universities or other institutions of higher education. Two-year courses leading to the General Certificate of Education (Advanced level) of London University are available in pure and applied mathematics, physics, chemistry, botany, zoology, biology, and engineering drawing.

Teacher training schools

Teacher training schools in Nigeria fall into the following main classes: (a) rural education centres; (b) Grade II (higher elementary); (c) Grade III (elementary); (d) preliminary; (e) Grade IV.

The last four of these classes may be regarded as second-

ary, although it is doubtful if Grade IV is much more than primary.

Grade IV training schools. These exist only in the North. They were previously known as vernacular training centres, and accept entrants from class 4 of the primary school. The course is 4 years and after obtaining the Grade IV Certificate a student may go on by means of a 'bridge course' to a Grade III training college.

Preliminary training centres. These centres were developed in the East and in Southern Cameroons to provide a one-year course for the brighter pupils of primary schools, after which they would teach for two years and then enter a Grade III training college. The two-year teaching period is often omitted. Many of the preliminary training centres have been converted to Grade III colleges to help meet the growing demand for teachers.

Grade III (*Elementary*). Grade III colleges are found in all regions. The course is a 2-year one except in the North where it is 3 years. In the West the minimum qualification for entry is 'Modern II', i.e., a school leaving certificate awarded at the end of the second year in the secondary modern school. The standard is likely to be raised to Modern III in the near future. Elsewhere the minimum qualification is the Primary School Leaving Certificate. The majority of students teach for a period before they enter the Grade III college.

The curriculum, which is of general application, includes English, arithmetic, school organization, physical and health education, language method (vernacular and English), arithmetic method, and matter and method of such other subjects in the primary school curriculum as a Ministry of Education may require. At the end of the course the student is examined in these subjects, the syllabuses of which are prescribed by the individual Ministries of Education, and undergoes practical tests in class teaching (including physical education), spoken English, and in any two of rural science or gardening, domestic science, needlework, handwork, art, and such other subjects as a Ministry of Education shall determine.

The examination is internally set in the North, Lagos and Southern Cameroons, and moderated by inspectors, and in the East and West it is set by the Ministries of Education.

The staff of the Grade III colleges consists largely of Grade II teachers, but in the North there is a high proportion of expatriate graduates and holders of Ministry of Education Certificates of the United Kingdom or University of London Institute of Education Certificates.

Grade II (*Higher Elementary*). Although the Grade III college accepts many of its students after they have taught for a period, thus introducing a break in the continuity of their schooling, the education it offers must be regarded as secondary without doubt. The Grade II college is not quite in the same situation. There are two types, one offering a 4-year course and the other a 2-year. The majority of students have taught for some time and, in the 2-year colleges, hold a Grade III Certificate. The break in continuity may be considerable, but as the standard of education is certainly no higher than that of the General Certificate of Education (Advanced level), and may be lower, it is reasonable to include the Grade II colleges in this brief description of secondary education in Nigeria.

The curriculum in both types of Grade II college include principles and practice of education, English language, comprehension and grammar, and arithmetical processes, all of which are examined by the West African Examinations Council, and physical and health education, English literature, history, geography and practical mathematics, which are examined internally or by a Ministry of Education. Students are also tested in class teaching, spoken English, physical training and games, and from two to five other subjects from two groups, one of which has a strong practical bias and the other a strong academic bias.

The minimum qualifications for entry to a four-year Grade II college are the Primary School Leaving Certificate in the East, Lagos and Southern Cameroons, Secondary II in the North, and Modern II in the West. For the 2-year course, a Grade III Certificate with at least one year's teaching experience or School Certificate or a full course (without School Certificate) at a secondary school is required.

The staff of Grade II colleges consists of graduates, holders of certificates of the Ministry of Education or the University of London in the United Kingdom, Grade I teachers, and instructors in some practical subjects. The proportion of the several grades of staff varies considerably from college to college and region to region.

Grade III teachers are trained for the primary school and most of them are to be found there. Grade II teachers go mainly to the upper classes in primary schools, secondary modern schools, modern classes, Grade III colleges and the lower forms of secondary schools.

The conditions of award of Grade I certificates are such as to exclude the Grade I teacher from a description of secondary education.

Out-of-class activities

In most schools and colleges the secondary level pupils participate to some extent in school government. There is, however, considerable variation in the kind and amount of participation. In this connexion it must be remembered that students at technical institutes and teacher training colleges are on the whole older and more mature than pupils of general secondary schools. At one end of the scale are schools with a simple prefectorial or monitorial system, with officers appointed by the principal and staff, and at the other end are schools with elected officers, varied posts of responsibility and perhaps a school council. The house system is general, but it, again, varies from names with little significance except on the playing fields to well organized communities.

The majority of schools and colleges which have been described are boarding or part boarding. Consequently, organized out-of-class activities are of special importance.

There are a few examples of school councils run by the pupils themselves on the lines of the country's own legislature, and much good work has been done by committees of such councils. There are more examples of effective house systems where house officials have real authority and all the members have some say in the affairs of the house.

Most of the foregoing remarks may be applied to games. English traditional games and sports are usual, football, athletics and table tennis being very popular in boys' schools, and cricket, hockey, lawn tennis and basket-ball less so. Girls play netball, hockey, table tennis, lawn tennis, and take part in athletics. The participation of girls in games and sports is of comparatively recent growth. Swimming is popular with boys and girls where facilities exist.

Clubs and societies such as Boy Scouts, Red Cross, Girl Guides, gardening, photographic, debating, literary, science, natural history, geographical, dramatic and handicrafts are common. It is not possible to say how many schools have well organized clubs and societies, but the schools which offer a wide range of out-of-class activities of this kind are few. Most schools have a very limited number of clubs and societies, partly because of lack of staff and partly because the importance of these activities is not fully appreciated.

One centre deserves special mention. It is called the Man O'War Bay Training Centre, and is situated on the coast of Southern Cameroons, but is open to persons of both sexes from all parts of the Federation. Courses are designed for training in citizenship and community development, and to give ample opportunity for qualities of leadership, self-reliance and service to develop. Those selected to attend come from schools, colleges, local authorities, business houses, the teaching profession, the police, government departments and corporations.

TRENDS AND PROBLEMS

The pattern of secondary education remained virtually unchanged from 1900 to the end of World War II. Grammar type schools and teacher training colleges had a clear field. Their number was small, provision for the education of girls was negligible, and although towards the end of the period pressure on the Government to assist by building schools and increasing grants-in-aid was apparent, it was not great enough to influence public opinion to such an extent as to make demands for expansion imperative. Technical education was, in the words of a Director of Education immediately after World War II, 'left to other interested departments'.

During this period the North had lagged behind, largely because its predominantly Muslim population was hesitant to accept Western ideas on education, particularly the education of women and girls.

The following table shows the development in secondary education since 1947. For this year (1947) the figures are approximate and none is available for technical and vocational education.

The table shows that secondary (general) schools and teacher training colleges increased rapidly in number and enrolment during the decade covered, and that the rate of increase was greater towards the end of the period. These figures should, however, be interpreted in the light of certain specific developments. In 1955 the majority of secondary (general) schools were of the grammar type and the exceptionally large increase from 163 to 477 in 1957 is due principally to the establishment of over 250

DEVELOPMENT OF SECONDARY EDUCATION, 1947–57

Type of school	Number of schools				Enrolment			
	1947	1950	1955	1957	1947	1950	1955	1957
Secondary (General)	60	120	163	477	11 000	22 200	28 243	67 250
Teacher training	80	111	174	311	4 000	6 200	12 862	23 186
Technical and vocational	..	15	11	34	....	1 207	2 256	5 782
Total	...	246	348	822	.....	29 607	43 361	96 228

secondary modern schools in the Western Region. By the same token, the increase in technical and vocational schools from 11 to 34 is largely due to the inclusion in this branch of 15 commercial schools with an enrolment of 2,590 in the Eastern Region in 1957.

The plans made at the end of World War II for the expansion of secondary education presumably seemed reasonable to the planners in view of the financial limitations of the time and the expected rate of development of the country. Looked at now, they appear inadequate, because they did not take into account the problems which arose at the arrival or near approach of self-government.

After 1954 the problems became acute and their magnitude became apparent to many who had not considered them before. The response varied from region to region and from one branch of secondary education to another.

The problems can be stated quite simply. They were: (a) how to meet the popular demand for education for all in the West, East and Lagos; and (b) how to train the large numbers of Nigerian administrators, executives, technicians and all grades of skilled clerical, commercial and industrial workers that were necessary for the proper development of the country (with or without independence), and the replacement of expatriates (with independence).

Although it has more than half the population of Nigeria, the North has lagged behind the South in the provision of education as a whole. With the exception of technical education, all branches of primary and secondary education are much less developed in the North than in the South. One example will suffice: in 1957 there were 2,945 boys and 345 girls in secondary (general) schools in the North, and in Lagos alone there were 2,949 boys and 1,138 girls in such schools. The reasons for this are partly industrial and partly political. Free primary education has not been introduced and the popular demand for education is by no means overwhelming.

In the Western and Eastern Regions and in Lagos, there was considerable popular demand, which was met, separately in each case, by introducing free primary education. As a result the problems of secondary education were greatly magnified. Previously there had been secondary education facilities for only a comparatively small proportion of the primary school leavers. Expansion to provide for the remainder was a sufficient problem, which was, in fact, being vigorously dealt with. Now something had to be done to provide not only for this remainder but also for the flood of primary school leavers to come.

The West established secondary modern schools as

quickly as possible with whatever buildings were available or could be built, and with whatever staff and equipment could be obtained, and accelerated the expansion of secondary grammar schools. Elsewhere in the South, a few modern classes appeared and there was some increase in the number of grammar schools, but up to the end of 1957 no great expansion in secondary (general) education had taken place. Even if schools could be provided for all children at the secondary level there remains the major problem of finding the staff to teach them. The South adopted a policy of expanding primary and secondary education and then turned their attention to the problem of obtaining more teachers. Training facilities were rapidly increased but the same problem arose—there were not enough qualified tutors to train the teachers.

There is, consequently, a serious shortage of qualified teachers at the primary and secondary level. The problem cannot be stated simply because it is complicated by the existence of a considerable number of expatriate teachers in secondary grammar schools, technical and vocational schools, and training colleges, who may or may not stay in the country. It seems, however, that the first step must be to provide suitably qualified staff for the training colleges so that teachers for the primary schools, the secondary modern school and the lower forms of the secondary grammar school can be produced. Plans to this end are being formulated.

The training of qualified staff for the upper forms of secondary grammar schools and technical institutes is dependent on the facilities available for higher education. Expansion of the existing facilities in Nigeria is being considered, and scholarship schemes to finance students at home and abroad are well developed. But, as yet, the means of obtaining suitably qualified Nigerians to fill positions in government, commerce, industry and education are inadequate.

The position with regard to technical education requires further attention. Three technical institutes and a handful of trade centres are recognized by the Ministries of Education as insufficient for a country of over 30 million inhabitants. The main (and possibly the only) obstacle to development is the difficulty of obtaining qualified staff, nearly all of whom must still be recruited overseas. It is interesting to observe that the problems of secondary education today tend to move in circles. Pupils must be educated at the secondary level to provide the material for future administrators, executives, teachers and other professionals, and skilled workers of all kinds, but before the pupils can be educated they must have properly qualified teachers. Clearly, therefore, the main problem in Nigeria today is the provision of more and better qualified teachers. Realistic plans are now under active consideration. With the help of financial assistance from external sources progress should be made in the very near future towards supplementing the efforts which are being made locally with Nigerian funds.

At the time of writing, various surveys—federal and regional—are taking place or about to start. These surveys will high-light priority problems and, it is hoped, suggest means of solving them in ways best suited to the varied needs but not unlimited resources of Nigeria. Among other matters now under consideration are:

1. The growth and development of professional associations and their collaboration with the various Ministries of Education and in particular the Joint Consultative Committee, referred to above.
2. Student counselling and vocational guidance—careers masters and mistresses.
3. The use of broadcasting in education.
4. The development of post-school certificate work as a prelude to admission to institutions of higher education.
5. Ways and means of benefiting from international organizations offering technical and financial assistance in the field of education.
6. The development and maintenance of academic standards throughout the Federation by such means as the consolidation and expansion of the work of the West African Examinations Council and by developing the ideas of joint consultation on common problems.
7. Planning scholarship schemes in relation to Nigeria's anticipated needs for university graduates in all fields.
8. Variation of the traditional pattern of secondary education to meet the needs of the country in all fields.
9. Training of Nigerian teachers and the recruitment and retention of expatriate teachers in the meantime.
10. Improvements in methods of inspection.
11. Improvements in the methods of teaching English, spoken and written, at all levels.
12. Adjustment and modification of syllabuses at all levels to relate what is taught more closely to Nigeria's needs and interests. In this problem the Joint Consultative Committee, Sub-Committee of the West African Examinations Council and professional associations collaborate. There are also various syllabus committees dealing with this problem.

STATISTICS

FEDERATION OF NIGERIA

Population (mid-year 1958 estimate): 33,052,000.
Area: 339,169 square miles; 878,447 square kilometres.
Population density: 97 per square mile; 38 per square kilometre.

The following comments on statistics cover the Trust Territory of British Cameroons as well as the Federation of Nigeria.

Summary of school statistics, 1953–57. In the school year 1957 enrolment in educational institutions of all levels totalled 2,600,000 pupils, representing about 8 per cent of the estimated population of Nigeria and the Trust Territory of the British Cameroons. Of the school-going population approximately 96 per cent were in primary schools and nearly 4 per cent in all secondary schools including teacher training colleges. There were in addition 1,458 students, of whom 88 were women, at Ibadan University and at the Nigerian College of Technology. The proportion of girls enrolled was 35 per cent in primary, 18 per cent in general secondary and 22 per cent in teacher training colleges. Compared with 1954 enrolment had increased at all educational levels. The increase in primary schools was 48 per cent and in teaching colleges 78 per cent. As regards general secondary schools comparisons with earlier years are not valid owing to the rapid development of secondary modern schools. The teaching staff in all primary and secondary schools in 1957 numbered about 92,500 of whom 19 per cent were women. The average pupil-teacher ratio in primary schools was 29 and in general secondary schools 19. (See Table 1.)

Examination results in secondary education, 1955–57. Results of secondary examinations for the whole Federation are only available since 1955/56. Between 1955/56 and 1957/58 the number of students awarded the West African School Certificate increased from 2,079 to 2,552 (23 per cent). In 1957/58, 289 girls were awarded this certificate, an increase of 55 per cent over the figure for 1956/57. Successful candidates for the General Certificate of Education increased from 709 in 1956/57 to 1,055 in 1957/58. Teaching certificates were awarded to 5,396 students in 1957/58. Numbers entering for other commercial and technical examinations also increased in 1957/58. (See Table 2.)

Educational finance, 1956/57. Total federal expenditure on education in the fiscal year beginning April 1956 amounted to 14,853,825 pounds sterling, or approximately £0.4 per inhabitant. Receipts were derived from regional governments and local authorities in the Federation, including the Southern Cameroons. (See Table 3B.) Of the total spent, £2,807,674 (19 per cent), was capital expenditure. The distribution of recurring expenditure by level and type of education for all regions, except the Southern Cameroons, is given in Table 3C.

1. Official exchange rate: 1 pound sterling = 2.80 U.S. dollars.
2. Includes expenditure by Southern Cameroons amounting to £335,400 for which the distribution is not available.
3. Not including expenditure by Southern Cameroons for which the distribution is not available.
4. Includes adult education.

THE EDUCATIONAL SYSTEM

The statutory basis of the present educational system (apart from education at university level) is the Education Ordinance, 1953. The Minister of Education is responsible for policy matters, while the Education Department does all the work necessary or incidental to the control of education by the Minister. There is an advisory Board of Education. Secondary education is controlled by the Ministry through the Department, either directly in the case of government secondary schools, or indirectly in the case of schools operated by churches, missions or governing boards.

The school course begins with a 7-year primary school, which leads to the various types of secondary education described below. Secondary school leavers have a variety of educational opportunities available to them, including degree and diploma courses at Fourah Bay College [a constituent college of the University of Durham (U.K.)], evening classes in various subjects at the Technical Institute, evening and part-time classes organized by the Extra-Mural Department of Fourah Bay College, and teacher training courses. There is also provision for sending selected students overseas at public expense to follow approved courses of study.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education was pioneered by the missionary societies. The first grammar school in Sierra Leone was established in 1845 by the Church Missionary Society, and similar schools were set up by various denominations in the next few decades. They were supported by means of pupils' fees and subsidies from missionary bodies. The Education Ordinance of 1911 first introduced the principle of financial assistance to secondary schools. A government secondary school (originally for the sons and nominees of chiefs) was established at Bo, but the development of secondary education was interrupted by the two wars and by the financial crisis in the 1930s. The Government opened a second secondary school, the Prince of Wales School, Freetown, in 1925. Since the second world war, efforts have been made to diversify the curriculum and break away from the formal grammar school type of secondary education; a secondary technical school was opened in 1957. There has been an increase in the number of school libraries.

During the period 1952–57 a number of 'junior secondary schools' were opened, providing a 3-year course of post-primary education. The Government has decided that they should be reclassified as secondary schools and should develop to full secondary status as soon as buildings and staff permit.

Regarding 'sixth forms' (post-School Certificate classes), the policy has been and remains to permit of the gradual introduction of work at this level where facilities, including staff, are considered adequate. In 1958 sixth forms were in operation at the Prince of Wales School, Freetown, the Government Secondary School, Bo, the Annie Walsh Memorial School, Freetown, and the Sierra Leone Grammar School, Freetown.

Secondary education is not free, but since the second world war the Government has adopted a very liberal policy in the award of scholarships. Local authorities and commercial firms also award scholarships.

Legal basis

The Education Ordinance, 1953, governs secondary education. The Grant-in-Aid Rules made under this ordinance are the basic regulations applicable to secondary education; their main purpose is to ensure that instruction, staffing, accommodation, equipment and attendance meet the requirements of the Department. They also provide that no pupil shall be refused admission to an aided school on religious grounds, or receive any religious instruction to which objection is raised by his parents or guardians.

Administration

In formulating policies for secondary education the Minister of Education may seek the views of the following in addition to those of his professional advisors and, of course, his colleagues in the Government: the Board of Education, the Advisory Committee on Secondary Education (composed mainly of heads of institutions), the Council of Principals of the Freetown Secondary Schools, the West African Examinations Council, and the Amalgamated Teachers' Organizations—the trade union to which the majority of teachers in secondary and primary schools belong.

Professionally qualified staff of the Department of Education is responsible for supervision and inspection. The aim is to interfere as little as possible, while at the same time trying to raise professional standards.

As regards the financing of secondary education, there are three main sources of funds: the Central Government, school fees, and grants from the United Kingdom for capital expenditure.

In the case of aided or assisted schools, the basis on which the funds are distributed by grants-in-aid is 95 per cent of the approved salaries of approved staff and £1 per pupil for equipment. Grants are also given for libraries, science equipment and clerical assistance, and in the case of certain schools a *per capita* boarding grant. The necessary additional funds for running these schools are derived from fees, at the standard rate of £12.12 s. per annum in Freetown but varying slightly in the Provinces.

In five government secondary schools in the Provinces boarding is at present free, being a charge on the Central

Government. Parents who are unable to pay fees are assisted by means of scholarships. Between one-third and one-quarter of all pupils are at present on scholarship, i.e., they pay no tuition fees.

TYPES OF SECONDARY EDUCATION

The following types of secondary education exist: (a) grammar, a 5-year course, or in the case of schools with sixth forms, a 7-year course; (b) modern (at present, for girls only), a 4-year course operated side by side with the grammar course in girls' schools; (c) secondary technical; (d) evening classes in subjects at secondary level.

The selection of pupils for the appropriate type of secondary education is by the Common Entrance Examination for admission to secondary schools, held annually in the seventh primary year, the subjects being English and arithmetic.

The school year is from September until June. Saturdays and Sundays are observed as holidays and there are about 11 public holidays during a normal year. A school day commences at about 8.30 a.m. and consists of seven or eight periods each of 40 minutes' duration.

English is the language of instruction in all schools.

General secondary schools. The aim of the grammar type of school is to provide an education enabling pupils either to proceed to courses of further training at universities or similar institutions, or to obtain employment at the clerical or executive level. Pupils in this type of school are not prepared directly for particular careers. They are selected through the Common Entrance examination, places being available for about 25 per cent of candidates who sit the examination.

An external examination, the West African School Certificate examination, is taken in the fifth year in a minimum of six subjects, and in certain schools a further examination, the Cambridge Higher School Certificate examination, in three or four subjects in the seventh year. The body responsible for conducting these external examinations is the West African Examinations Council, which has its headquarters in Accra, Ghana.

The subjects taught to School Certificate level are chemistry, physics, zoology, botany, mathematics, English, Latin, French, geography, economics, history, religious knowledge, art, technical drawing, commerce, health science, biology, cookery, needlework, housecraft and woodwork; and to Higher School Certificate level, the first 10 on this list. Other subjects include physical education and music.

A 4-year modern course for girls is conducted in the girls' grammar schools. The aim is to prepare girls for married life and also to enable them to enter training courses for such professions as nursing and teaching at the sub-graduate level. During the fourth year of the course the Education Department conducts an examination in the following subjects: English, arithmetic, housecraft, needlework, hygiene, child welfare and home nursing. A certificate is issued to successful candidates, who average about 70 per cent of the number presented for the examination.

There are evening classes in secondary school subjects at the Freetown Technical Institute, providing opportunities for students who for one reason or another have not passed successfully through the full secondary grammar course. The principal subjects are English, Latin, geography, mathematics, physics, chemistry, zoology. They are taught to the stage of the London General Certificate of Education Ordinary and Advanced levels, which are approximately equivalent to the School Certificate and Higher School Certificate respectively.

Vocational and technical schools. The only technical institution at the secondary level in Sierra Leone is the Government Secondary Technical School, Freetown, which opened in 1957. The aim of this school, which is co-educational, is to provide a course of training leading to the West African School Certificate in technical as well as general subjects, and it is anticipated that the boys who successfully complete the course will proceed to further training in engineering, etc. Pupils are selected through the Common Entrance examination mentioned above. The subjects taught include the basic 'tool' subjects and, in addition, mechanics, woodwork, metalwork and mechanical drawing for boys and domestic science for girls. It is intended that these practical subjects shall be taken in the School Certificate examination.

Other institutions of a vocational or technical nature on approximately the secondary level include the technical institutes at Freetown and at Kenama, South Eastern Province. At these institutes some trade training is carried out, but their main aims are the training of artisans and of clerks for the Civil Service. Trainees are selected by competitive examination. Training is either full-time day, or part-time day (apprentices and others) or evening, and the courses include engineering (mechanical), engineering (electrical including telecommunications), carpentry, masonry, painting and decorating, commercial, pre-apprentice training, instructor training. Trainees enter for the Intermediate examinations of the City and Guilds of London Institute in technical subjects and for the appropriate stage of the Royal Society of Arts examinations in commercial subjects. There are also trade schools operated by two large mining companies for their employees.

Teachers. The object is to staff the secondary schools with as many trained graduates as possible. In 1958, of the 335 teachers employed in these schools 126 held degrees of recognized universities. Two courses of training are provided locally for secondary school teachers: (a) A 1-year professional course for graduates, leading to the Durham University Diploma of Education. This is conducted in a sub-faculty of the Arts Faculty at Fourah Bay College and is under the control of a Senior Lecturer in Education. The final examination, apart from that in practical teaching (which is held locally), in conducted by Durham University. (b) A 3-year course leading to the Sierra Leone Teachers' Advanced Certificate. This is conducted in the non-graduate Department of Teacher Training at Fourah Bay College, under the control of the Director of Teacher Training. Only holders of the School Certificate are eligible for admission, there being no formal entrance examination. The aim of the curriculum is to enlarge the students' academic knowledge of at least two subjects, and also to

equip them with teaching techniques appropriate for the lower forms of secondary schools. Professional work covers educational psychology, principles of education, the history of education, and teaching method. Students are examined in practical teaching in addition to theory.

A Sierra Leone qualified graduate teacher has a salary commencing at £660 per annum and rising to £1,476. Principals and vice-principals of secondary schools are remunerated at higher rates according to the type and size of school.

The teaching staff for the evening courses in secondary subjects consists partly of teachers employed at the Technical Institute but chiefly of teachers who are on the full-time staffs of secondary grammar schools and Fourah Bay College.

Out-of-class activities. Teachers and teachers-in-training are made aware of the important role of the school in character formation. Efforts are made to educate pupils in their duties as citizens and to develop in them self-reliance and a willingness to co-operate with others. It is usual in the secondary schools to devote some time to civics and economics, or to current events, and to have a measure of self-government by the pupils. All the secondary schools have clubs and societies, and school sports.

TRENDS AND PROBLEMS

The Ministry of Education's preoccupations as regards secondary education are set out in the government's White Paper on Educational Development, summarized in the following paragraphs:

It is the government's intention: (a) to set up nine new secondary schools; (b) to develop all existing junior secondary schools to full secondary status; and (c) to provide secondary modern schools.

So far as Freetown is concerned, the emphasis has been primarily on physical reconstruction and extension rather than on the foundation of new schools. It is intended shortly to build a boys' and a girls' secondary school, each with an Islamic background, in recognition of the long-deferred aspirations of the Muslim population.

In the Provinces, seven new secondary schools, i.e., at Bo, Port Loko, Jaiama, Taiama, Makeni, Kailahun and Magburaka, have already been approved, and work has commenced on permanent buildings.

The Government will continue to keep in view, as industrial development progresses, the necessity of providing separate secondary technical schools such as the school already provided in association with the Freetown Technical Institute. Schools of this type will give a general education related to one or other of the main branches of industry (including agriculture) or commerce. Apart from their value from the industrial point of view, such schools meet the needs of boys and girls with a practical turn of mind, and provide that sense of reality and objective which makes a direct appeal to young people of this kind.

Nevertheless, the grammar/technical school is designed for children whose abilities are likely to lead them as far as School Certificate and it remains a disturbing feature of the present system that, apart from a few senior primary classes, no provision exists for pupils who, at the end of the primary course, fail to gain admission to a secondary school or a technical or vocational course. To cater for these, the Government now proposes the establishment of secondary modern schools offering initially a 3-year course (forms 1 to 3) but without prejudice and, indeed, with every encouragement to their growing a fourth or even fifth form as occasion and the calibre of the late developers may warrant. These schools will offer a broad general education closely related to the interests and environment of the pupils.

There is a lack of properly qualified and trained staff. Efforts to recruit overseas staff on contract terms will be continued until more local staff is available. Adequate housing provision will be included in all schemes for secondary school development and indigenous staff will also be catered for in areas where the situation makes it necessary. To ensure continuity in instruction, the Government has now introduced a system whereby all senior teaching staff are required to take their leave during the period of the long vacation.

It is the government's intention to widen the scope of the secondary school curriculum by introducing more foreign languages, e.g., German, Italian, Spanish. The object of this development is to enable students who may be offered travelling scholarships by the Government to take the fullest advantage of them; it also looks forward to the time when it will become necessary to train Sierra Leoneans for diplomatic and consular careers.

STATISTICS

Total population (mid-year 1958 estimate): 2,260,000.
Area: 27,925 square miles; 72,326 square kilometres.
Population density: 81 per square mile; 31 per square kilometre.

Summary of school statistics, 1953–57. In 1957 enrolment in all educational institutions was approximately 69,500, representing some 3 per cent of the total population. Of the total enrolment, about 89 per cent were pupils in primary schools, 9 per cent in general secondary schools and 2 per cent in vocational and teacher training schools. In addition 371 students from Sierra Leone and other West African countries attended Fourah Bay College. The proportion of girls in primary schools was 32 per cent, in general secondary schools 33 per cent and in vocational and teacher training colleges 23 per cent. There were nearly 1,900 teachers in primary schools, of whom 33 per cent were women, and the average pupil-teacher ratio was 33. Compared with 1953, enrolment had increased by 4 per cent in primary and by 79 per cent in general secondary schools. In teacher training schools total enrolment increased by 45 per cent between 1953 and 1957 but the number of women students declined slightly over this period. The teaching staff in general secondary schools numbered 311 in 1957 and the average pupil-teacher ratio was 19. (See Table 2.)

Enrolment trends in secondary education, 1947–57. Average total enrolment in all types of secondary school more than doubled between 1947 and 1957. The ratio of secondary enrolment to the age group 15–19 years old rose from 1.0 over the period 1947–49 to 2.6 in the three years 1955–57. (See Table 4.)

Educational finance, 1958. Total expenditure on education in the fiscal year beginning January 1958 was 1,790,986 pounds sterling, or approximately £0.8 per inhabitant. Of the total spent, 74 per cent was contributed by the Central Government, 5 per cent came from school fees, 6 per cent from local authorities, and 14 per cent came from external sources (£252,000 from Colonial Development and Welfare and £3,232 from the International Co-operation Administration). Capital expenditure was about 17 per cent of the total. (See Table 1.)

ADEN

The Colony of Aden comprises a small area formed by a high rocky peninsula and a local isthmus on the southern coast of Arabia, and the island of Perim, situated in the straits of Bab-el-Mandeb. To the north-east of the Colony lie the two Protectorates, Western and Eastern, the latter including the Hadhramaut, which stretch along the seaboard to the border of the Sultanate of Muscat. The area consists of a number of small Arab States, some of which are based on tribal units, whose sultans and chiefs are advised by British political officers.

Arabic is the sole language of the Protectorates but in the Colony Arabic, English, Gujerati, Urdu and Hebrew are spoken as mother tongues by the various racial communities.

THE EDUCATIONAL SYSTEM

In the Colony, education is under the control of the Director of Education, who is responsible to the Governor. The present legal basis of the system is the Education Ordinance of 1952 and rules and regulations made under the ordinance. Schools are classified as maintained by local government and colonial funds, aided by these funds, or independent. The aided schools are required to meet criteria established by the Director, and all non-government schools, whether aided or independent, are open to inspection by the Education Department. Regulations for the employment and further training of apprentices are laid down in the Apprentice Training Ordinance of 1956.

In each of the two Protectorates education is under the immediate general guidance of the British Agent, who is assisted by a Protectorate Education Officer who, in turn, is advised by the Director of Education of Aden Colony. The present policy is to build up self-supporting departments of education as the various states and sultanates become sufficiently advanced to make this possible. All expenditure on education over and above what the states can afford is borne by the United Kingdom Government.

The organization of the school system is based on a four year primary school followed by a three-year intermediate school (four years in the Eastern Aden Protectorate). These two stages cover the type of curriculum associated with primary education in other countries. From the intermediate schools selected pupils go forward to institutions providing general and technical education at secondary level and teacher training. There is no provision for higher education, but a system of scholarships enables selected secondary graduates to continue their education overseas.

There is no compulsory education as the demand for schooling still exceeds supply.

THE DEVELOPMENT OF SECONDARY EDUCATION

Until 1950 the only institution providing education at secondary level was the Government Secondary School which offered a 4-year general course for boys. Expansion of facilities began under a five-year plan initiated in 1948. The year 1951 saw the opening of a technical college which later became the day school of what was redesignated the Aden Technical Institute, an institution embracing all the activities of full-day apprentice classes, and part-time day and evening classes. Aden College, which replaced the Government Secondary School, was opened in 1953 and Aden Girls' College in 1956. From the latter year Aden College has provided a 6-year course (forms 1 to 6) leading to the General Certificate of Education Examination at Advanced level. The teacher training section formerly provided at Aden College is now run as a separate training centre in its own premises.

Designed and constructed on a generous scale, the three new government schools include up-to-date and well equipped classrooms, laboratories, special subject rooms, workshops, libraries and recreational rooms. Aden College has a boarding establishment for boys from the protectorates, a hospital unit and a mosque.

Of the six non-government schools providing secondary education the St. Joseph's Boys' School (grant-aided) was recognized by the Government in 1956 as being of equal status to Aden College.

Secondary education is fee-paying; fees payable in government and grant-aided schools are laid down in the School Fees Rules 1956.

Most schools have a parents' committee which meets regularly to discuss day-to-day problems with the Director of Education, the head teachers and senior members of the Education Department. A certain number of social welfare services are provided, notably the annual medical and dental inspection by the Colony Medical Department.

The only post-intermediate institution in the Protectorates is a junior secondary school at Gheil Ba Wazir in the Eastern Aden Protectorate. The school provides courses of 2 years; during the final year boys specialize either in clerical work or in teacher training. For further general secondary education pupils are sent either to Aden College or abroad, for vocational secondary education to the Aden Technical Institute, and for teacher training to the Colony Teacher Training Centre. Protectorate boys studying in the colony are supported out of Colonial Development and Welfare funds or by scholarships provided by their respective states.

TYPES OF SECONDARY EDUCATION

General secondary schools. Entrance to Aden College is by competitive examination at the completion of intermediate school (7 years' formal schooling); candidates must be under 15 years of age. The course leads in four years to the General Certificate of Education, Ordinary level, and in five or six years to the Advanced level. The curriculum includes English, Arabic, mathematics, physics, chemistry, biology, history, geography, religion, art and physical training.

Pupils who have successfully completed their secondary education in Aden are eligible for selection for scholarships provided by the Government, the Aden Municipality and the Aden Port Trust. Among countries in which Aden students have held such scholarships are Egypt, India, Lebanon, Sudan and the United Kingdom.

Football, volley-ball and other organized games form an integral part of school life. Inter-schools' athletics competitions are held annually. A social sense is instilled into the pupils by the fostering of school societies, such as musical, dramatic and photographic societies, and by the delegation of a certain amount of responsibility for the conduct of school life. In some schools the School General Society, usually under the presidency of the head prefect, puts forward suggestions for the consideration of the headmaster and his staff.

Teachers holding senior posts in secondary schools are recruited overseas, passage allowances being paid. Aden College provides houses in the school grounds for all teaching and other staff.

The Technical Institute. Entrants must have completed intermediate school (seven years' schooling) and passed an entrance examination. There are full-time 4-year courses in engineer fitting, electrical engineering practice, carpentry and joinery, cabinet making and motor vehicle mechanics. These courses, which include academic subjects of the same standard as Aden College, lead to the Intermediate Examination of the City and Guilds of London Institute. Two-year courses in craftwork are provided for boys below the educational standard required for the City and Guilds courses, and 2-year clerical courses for students unable to obtain places at Aden College.

There are part-time classes for indentured apprentices released from industry under the terms of the Apprentice Training Ordinance, and sandwich courses of 4 to 5 months for junior clerks in government departments and commercial firms. The institute has a branch establishment at Little Aden for apprentices and junior employees at the oil refinery.

Pupils at the day school participate in extra-curricula activities similar to those provided in general secondary schools. Teachers are recruited overseas and from among local students with overseas experience. There is also a large part-time staff of instructors recruited locally from government departments, private firms and the Royal Air Force.

Teacher training centres. Teacher training is provided for men and women in separate centres. The minimum qualification for entry is five years' primary education, although the usual requirement is the General Certificate of Education (11 years' schooling).

STATISTICS: ADEN COLONY

Population (mid-year 1958 estimate): 150,000.
Area: 80 square miles; 207 square kilometres.
Population density: 1,875 per square mile; 725 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 total enrolment in the Colony was 11,647 pupils representing approximately 8 per cent of total population; 87 per cent of enrolment was in primary schools, 10 per cent in general secondary schools, 2.5 per cent in vocational schools and the remainder in teacher training centres. Girls made up 29 per cent of enrolment in primary schools, 15 per cent in general secondary schools and 21 per cent in teacher training centres. The teaching staff, excluding teacher training centres, numbered 454 in 1957/58 and the pupil-teacher ratio was 28 in primary schools and 17 in secondary schools. Compared with 1953/54 enrolment in primary schools increased by 39 per cent and in general and vocational secondary schools by over 160 per cent (from 543 pupils to 1,427 in 1957/58). (See Table 2.)

Examination results in secondary education, 1956–57. Sixteen candidates passed the General Certificate of Education at Ordinary level in 1956/57 and four passed the same examination at Advanced level in 1957/58. Twelve teaching certificates were awarded in 1956/57.

Educational finance, 1956/57. Total expenditure on education in the fiscal year beginning April 1956 was 325,828 pounds sterling, or about £2.2 per inhabitant. Of this sum, 32 per cent (£103,110) was contributed from United Kingdom funds and 68 per cent (£222,718) from Territorial revenue. Capital expenditure (£119,540) made up 37 per cent of the total spent. The distribution of recurring expenditure by level and type of education is given in Table 1.

STATISTICS: ADEN PROTECTORATES

Population (mid-year 1958 estimate): 650,000.
Area: 112,000 square miles; 290,080 square kilometres.
Population density: 6 per square mile; 2 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 there were some 12,100 pupils enrolled in government maintained and aided schools. There were in addition an unknown number of children in unaided Koranic schools. Total enrolment in officially recognized schools represented about 2 per cent of the estimated population. Girls made up only 5 per cent of the enrolment in primary schools and none so far attended secondary schools. There were 22 pupils in the public junior secondary school in 1957/58 compared with 35 in 1953/54. The reason for this decline is not known. In 1957/58, 26 students were taking a teacher training course. There was an increase in total primary school enrolment of 58 per cent in 1957/58 compared with 1953/54 but the number of girls attending declined over the period under review. (See Table 2.)

Examination results in secondary education, 1957/58. In 1957/58, 26 candidates passed the final teacher training examinations in the Eastern Aden Protectorate.

Educational finance, 1956/57. Total expenditure on education in the fiscal year beginning April 1956 amounted to 130,110 pounds sterling, being £0.2 per inhabitant. Of this total 28 per cent (£35,865) was contributed from United Kingdom funds and the remainder (£94,245) by local authorities. Capital expenditure was mainly confined to the Western Protectorate and represented 14 per cent (£17,704) of the total spent. The distribution of recurring expenditure by level and type of education is given in Table 1.

BRUNEI

THE EDUCATIONAL SYSTEM

The educational system in the State of Brunei is divided into three main groups: (a) government primary vernacular schools and secondary schools (in which the media of instruction are Malay and English respectively); (b) mission schools, primary and secondary, in which the medium is English; and (c) Chinese schools, which use Chinese (Mandarin).

Although the three principal groups are distinct there is a sufficient measure of integration and government assistance to ensure that the various agencies function in a unified manner.

Educational policy is determined by the Sultan-in-Council. Responsibility for administration and general control of the school system is entrusted to the Education Department which is headed by the State Education Officer. There is also a consultative body, the Advisory Committee on Education, which includes representatives of the State Council, the Malay and Chinese communities and the schools. A scholarship committee recommends the award of local and overseas scholarships.

Under the Education Enactment 1952, which amended and consolidated previous legislation, non-government schools and their managers, and the teachers in these schools, must register with the State Education Officer, who is empowered to enter and inspect all schools. The General Regulations for Schools, 1939, were given continued validity by the 1952 Enactment; they relate to hygiene and sanitation discipline, registers, reports and books of accounts, prohibition of the use of schools for undesirable purposes, control and supervision of subscriptions and collections on behalf of schools, etc.

The government English language secondary schools and primary vernacular schools (Malay) are financed and administered by the Education Department and most of the teachers are in permanent established posts or seconded from the United Kingdom or Malaya.

Each Chinese school is organized and supervised by a Chinese school committee, headed by a supervisor. The

Government nominates one-half of the committee and pays 50 per cent of the recurrent costs of running the school. The remainder comes from school fees, and from collections and contributions made by the local Chinese community. Building grants not exceeding 50 per cent of the total cost are made.

Mission schools are controlled by the missionary bodies concerned. Each school must have a registered committee with a supervisor or chairman. The mission schools receive financial aid from the Government in the form of grants which are based on the qualifications of the teachers in those schools but do not exceed 33⅓ per cent of the total cost of salaries. Grants towards new buildings are also made. Government policy towards mission schools is under revision.

In addition to the three main agencies providing education, a private company maintains a primary school for the children of its senior officers and also a trades school.

The pupils in Brunei schools are from many different ethnic groups, principally Malay, Kedayan, Chinese, Dusun, Indian, Eurasian and Iban. Other very small groups include Murut, Javanese, and Europeans.

Compulsory education has not yet been instituted in the State but it is estimated that over 90 per cent of the boys and 60 per cent of the girls attend school. It should be noted that the School Attendance Enactment, 1939, empowering the Education Department to require the attendance at a particular government vernacular school of any Malaysian boy between 7 and 14 years of age, is still in force. Education in these Malay schools is free and all textbooks and apparatus are provided.

The full primary course last 6 years, as does also the full general secondary course—forms 1 to 6 in the English-language schools and junior middle 1 to 3, followed by senior middle 1 to 3 in the Chinese schools.

THE DEVELOPMENT OF SECONDARY EDUCATION

There was practically no secondary education in English prior to 1951 with the exception of one mission school (Roman Catholic, at Seria) which had a few pupils staying on in school up to form 2. Government English secondary education was not really started until 1953 when a few children were selected for a preparatory English course after having passed primary 4 Malay; some Chinese, Indian and Eurasian pupils were included in these classes. Junior secondary education up to form 3 was available by 1955, when the Sarawak Junior Certificate was taken for the first time. (This was in fact the first time in the history of the State that candidates were entered for an external examination.) At the beginning of 1956 it was possible to start senior secondary education in Brunei Town. The first candidates for the Cambridge Oversea School Certificate sat the examination, taken after completing form 5. Opportunities were given during 1957 and 1958 for students who left school to go to evening classes preparing them for the (United Kingdom) General Certificate of Education. A further development in senior English secondary education was made in January 1959 when a sixth form was started at the Sultan Omar Ali Saifuddin College. At the present time selected Cambridge School Certificate holders are sent for their higher secondary education to a United Kingdom boarding school which specializes in preparing for the GCE Advanced level.

It is the policy of the Government to segregate boys from girls wherever possible. Owing to the fact that there was no provision for English education sponsored by the Government prior to 1951, the number of over-age pupils in secondary forms is still a problem and will be so for some time. Every effort has been made to provide hostel accommodation for children from country districts and by the beginning of January 1958 there were 292 children receiving either subsistence allowance or hostel accommodation.

Secondary education in mission schools has tried to keep abreast of the rapid development in government English schools. The missions schools are very greatly handicapped by being unable to attract a sufficient number of fully qualified trained teachers for their secondary department. However, improvements have been and are still being made and new accommodation for the pupils is increasing annually.

There has been considerable development in Chinese secondary education since 1954 when junior middle classes were started at two schools. Regular junior middle examinations are now taken (at the end of the 3-year junior course) and during 1957 a senior middle class was started at the Seria Chung Ching School.

Administration

The three principals of the government secondary schools are responsible to the State Education Officer, who is also the Registrar of all non-government secondary schools and teachers. He recommends what grants should be paid to non-government secondary schools, acts as local secretary for all secondary external examinations, and ensures the efficient running and administration of ancillary services to secondary schools.

Curricula are determined by the principals of the secondary schools with the approval of the Education Department.

Inspection of secondary schools is carried out by the State Education Officer or his representative; his staff includes a Chinese Inspector of Schools who advises on Chinese school affairs.

In government secondary schools all instruction is free and textbooks are supplied free of charge although a small number of non-scholarship holders receive textbooks only on loan. All mission schools and Chinese schools charge fees.

No standards are laid down for buildings and equipment but all new building plans have to be approved by the State Education Officer, the State Engineer, and the Municipal Board.

School welfare services include free meals at school, free medical inspection and treatment, and free dental inspection.

TYPES OF SECONDARY EDUCATION

General secondary schools

School holidays and term times are adapted to religious and community needs. Thus, in government secondary

schools, holidays and term times are planned to fit in with the Islamic year. Mission schools follow a European (British) pattern with Christian holidays. All schools have a five-day week with a maximum of 25 hours instruction per week.

Pupils wishing to present themselves as candidates for entry to government secondary schools must have completed primary 4 in a vernacular school (Malay or Chinese), reached the age of 13, be Brunei-born and be selected by a scholarship committee, such selection depending on attainment in the primary 4 examination. They then enter preparatory classes where there is considerable concentration on the teaching of English for two, or sometimes three, years. Thereafter, admittance to the secondary forms is determined by selection based on terminal examinations and the results of the Common Entrance examination. Admission to the secondary course in mission schools is open to pupils who have completed a primary course (English), which normally lasts 6 years. The Common Entrance examination results and primary school records are used when selection is made. Admission to the Chinese junior middle school is by a Common Entrance examination (in Chinese) which is held at the end of the 6-year primary course.

The education in government and mission secondary schools is similar. All instruction is full-time. Subjects taught include English, English literature, Malay, mathematics, science, hygiene, history and geography. Mission schools have religious instruction, and Malay pupils in government secondary schools receive religious instruction from special Muslim religious teachers. Government secondary education also makes provision for woodwork, metalwork, homecrafts, art and local crafts.

Chinese secondary schools teach Chinese, Malay, English, physics, history, geography and hygiene.

Terminal tests and end-of-year tests are held in all schools. Promotion is based on the results of these tests and school records. Report books are kept for each pupil in the government secondary schools. In secondary schools where English is the medium of instruction an external examination is held at the end of form 3 (Sarawak Junior Secondary School Certificate examination) and form 5 pupils sit for the Cambridge Oversea School Certificate and certain subjects of the General Certificate of Education (Associated Examining Board). Chinese schools prepare for the Junior and Senior Middle examinations, taken from junior middle 3 and senior middle 3 respectively. The examinations are set and marked by a special committee nominated by the State Education Officer and certificates are issued by the Education Department.

Most of the teachers in all three types of secondary schools, and particularly in the senior secondary forms, are specialist teachers, engaged to teach specific subjects. In the large government secondary schools specialists are in charge of certain subjects, e.g., English, science, mathematics, woodwork, metalwork, homecrafts, art and local crafts. The staff in government secondary schools is made up of European expatriate staff, regional expatriate staff and teachers seconded from Malaya. Expatriate staff are all graduate trained teachers. All 'regional teachers' are on short contract engagements (two or three years) and are recruited from Malaya, India, Burma, Ceylon and other countries in South-East Asia. Teachers seconded from Malaya have received secondary school education and professional training, some of them in the United Kingdom (Kirkby Training College). The staff of mission schools consists of expatriate European missionaries and regional expatriate staff, with varying qualifications. Teachers employed in Chinese schools are generally recruited from outside the State but the number of locally born teachers is increasing.

Vocational and technical schools

There is one trade school in the State which provides a full-time 3-year course. The school is administered and financed by a petroleum company, but the Government pays a proportionate share of the expenses for government-sponsored students. As the course progresses students spend an increasing part of their time in the workshops of the company. Subjects taught include blacksmithing, welding, automotive engineering, fitting, machining, sheet metal work, electrical practice. General educational subjects taught are mathematics, technical drawing, and science. English is studied outside normal school hours.

Teacher training schools

One institution in the State offers a 3-year course for vernacular teachers at upper primary and junior secondary level. Students are recruited from the Malay primary schools and are selected by examination and interview. Subjects in the curriculum include Malay language and literature, English, arithmetic, art, teaching method, educational psychology, hygiene, physical training, algebra and geometry, geography, history.

The staff consists of European expatriate officers, one of whom is the principal, and trained teachers seconded from Malaya.

Out-of-class activities

All pupils take part in organized games, the chief of which are, in order of priority, association football, badminton, hockey, basketball, rugby and cricket. Most of the secondary schools have clubs for social, cultural and educational activities—chess, exploring, photography, debating, etc. Outside organizations in which pupils enrol are the Boy Scouts, Girl Guides and Red Cross.

TRENDS AND PROBLEMS

The main factors which have to be considered when attempting to evaluate the trends and problems of secondary education in the State of Brunei are the rising school population which increases by approximately 10 per cent each year, the provision of well designed and well built school buildings to house the added number of pupils, modern quarters for teachers, the recruitment of well trained and well qualified teachers, and the revision of curricula and syllabuses so that the country's dire need of professionally qualified technicians and artisans can be met.

The first Development Plan for Education is now

virtually completed and part of that plan was the establishment of three major government secondary schools with adequate staff. This has been accomplished, but the trends now seem to indicate that the establishment of technical education and junior secondary education in the vernacular should be the next projects to be initiated. The introduction of technical education, and especially the recruitment of well qualified staff, will not be easy, and the integration of technical instruction with the well established academic type of learning will need time to become effective. A comprehensive survey has recently been made by Mr. J. C. Jones, CBE, Chief Technical Adviser to the Secretary of State, regarding proposals for practical training, junior technical training and apprenticeship schemes.

STATISTICS

Population (mid-year 1958 estimate): 77,000.
Area: 2,226 square miles; 5,765 square kilometres.
Population density: 35 per square mile; 13 per square kilometre.

Summary of school statistics, 1953–57. In 1957 total enrolment in primary and secondary schools was 11,260 pupils representing about 15 per cent of the total population. Of the total enrolment about 92 per cent were pupils in primary schools, 7 per cent in general secondary, 1.3 per cent in technical and 0.3 per cent in the teacher training centre. The proportion of girls enrolled was 37 per cent in primary and 30 per cent in general secondary schools. There were no girls in the teacher training centre in 1957. Enrolment in primary and general secondary schools increased by 87 per cent between 1953 and 1957. There were 383 primary school teachers in 1957, of whom 40 per cent were women, and 61 general secondary school teachers, of whom 36 per cent were women. The average pupil-teacher ratio was 27 in primary and 13 in general secondary schools in 1957. (See Table 2.)

Examination results in secondary education, 1953–57. The number of candidates passing the Sarawak Junior Secondary Certificate examination rose from 20 in 1955 to 40 in 1957. There were seven successes in the Cambridge Oversea School Certificate examination in the latter year.

Educational finance, 1957. Total expenditure on education in the fiscal year beginning January 1957 amounted to 6,014,769 Malayan dollars, or about $78 per inhabitant. Of this sum 74 per cent ($4,422,793) was contributed by the Central Government from territorial revenue, 13 per cent ($757,024) by Chinese school boards, 5 per cent ($321,067) by missions, and 8 per cent ($513,885) by the Brunei Shell Petroleum Company. Capital expenditure ($2,259,385) was 38 per cent of the total. The distribution of recurring expenditure by level and type of education is given in Table 1.

HONG KONG

THE EDUCATIONAL SYSTEM

The statutory basis of the educational system as a whole is the Education Ordinance of 1952, amended in 1958. This ordinance requires, and sets out the conditions for, the registration of all schools, school managers and teachers, and further requires the appointment by each registered school of a supervisor to act as an administrative link between the school and the Director of Education. Government schools are not registered under the enactment, nor are teachers in government schools. Under the ordinance, regulations are made in respect of such matters as structural and health requirements for schools, the keeping of registers and books of account, the control of fees, etc., and the proper conduct and efficiency of schools and teachers.

As will be seen in the section dealing with the historical development of secondary schools, linguistic and social factors have continuously influenced the policy for secondary education. The two media of instruction are Cantonese and English, but all textbooks for Chinese secondary schools are written in the Mandarin idiom, although taught in the Cantonese dialect; there is little or no writing in Cantonese. English has a much stronger commercial appeal for parents and pupils, as it increases the chance of employment, whereas Chinese has a stronger cultural appeal.

The Director of Education is in direct control of all government, aided and private schools. Private agencies play a considerable part in the educational system. Nearly 70 per cent of all secondary education is conducted in private schools.

In Chinese, Anglo-Chinese and English type schools, the school ladder begins with a six-year primary school, the usual age for admission being six years. The secondary curriculum leads to School Certificate examinations in both English and Chinese-medium schools. For pupils seeking university admission, there is provision for two further years of study leading to the University Entrance examination. There are various possibilities for vocational and technical training at secondary and post-secondary level; teacher training is post-secondary. Higher education and professional training are provided at the University of Hong Kong.

THE DEVELOPMENT OF SECONDARY EDUCATION

Prior to 1900, the Government had built one secondary school, which concentrated on an English education. In 1902, a committee was formed to report on education and prepare a policy. Out of this policy arose British schools for English children and a Chinese high school to provide an education in both Chinese and English. At the same time a reasonable form of grant was instituted to assist mission and other schools, and the old system of payment on results was abolished.

A technical institute was started in 1907 with the support of a government grant and an endowment. The founding of Hong Kong University in 1912 gave a stimulus to English secondary education, and shortly afterwards, the effects of the Chinese Revolution in 1911 were apparent in a revived interest in Chinese.

In 1913, the first Education Ordinance was passed, bringing all schools under government supervision; thereafter, the Government accepted full responsibility for the control of primary and secondary education. Secondary education in English was still encouraged not only by the Government, but by the Chinese as well, who fully realized the utilitarian and market value of the English language.

In 1920 a Board of Education was set up to advise the Director of Education, and by 1924 certain general principles were established. It was decided that as the Government could not educate all the Chinese, a good standard should be set in government schools, and other schools should be encouraged by grants and subsidies to copy their example. This principle, with modifications, is still observed.

In 1925–26, intensified Chinese nationalism led to pressure for the reform of vernacular education. As a result a middle school, with normal classes for teacher training, was started by the Government, and a number of private schools were established on this model. The organization of vernacular education was also altered to conform with the Chinese pattern, adopted in 1921, of a 6-year primary course, followed by a 3-year junior middle course, and a 3-year senior middle course. In 1928, the University of Hong Kong started a School of Chinese Studies, which further stimulated secondary education in Chinese.

When the slump of the early thirties focused attention on the need for technical and vocational schools, a junior technical school was opened in 1933 and a government trade school in 1937.

A visit by one of His Majesty's Inspectors in 1935 had significant results for secondary education. Amongst the suggestions which he made and which were implemented were the introduction of a sound selection examination for secondary school pupils, and the establishment of a course in Anglo-Chinese schools leading to a Hong Kong School Certificate. The latter was introduced in 1937 was not just an academic yardstick for the purposes of university selection, but served rather as a measure of general attainment.

Legal basis

The Education Ordinance (amended 1958) supplies the legal basis for secondary education. Other relevant legislation is included in the Factories and Industrial Undertakings Ordinance (Ordinance No. 34 of 1955, regulation 3) which states that no person under the age of 14 may be employed in any factory, business, or dangerous undertaking.

There is at present no local legislation governing apprenticeship, the Hong Kong Government following the United Kingdom pattern.

Administration

All major problems of policy are discussed by the Board of Education, whose advice is forwarded to the Governor by the Director of Education, together with any comments he may wish to make thereon. The implementation of policy together with the minor problems of policy are decided by the Director in consultation with the senior officers of the Department. Each type of non-government school, i.e., grant, subsidized and private, has representative councils or associations which advise on, and negotiate, points of policy concerning their respective schools, with the Director. A Syllabus and Textbook Committee meets under the chairmanship of the Assistant Director (Inspectorate). This is an overall body, and sub-committees for the various subjects report to it; the sub-committees frame syllabuses and review textbooks for approval by the Director, while the main committee puts up recommendations on policy to the Director. A development section plans accommodation and the financial aspect of educational policy. All these bodies are concerned with both primary and secondary education. A Standing Committee for Technical Education and Vocational Training deals with problems in this field and there is an Advisory Committee to assist the Principal of the Technical College. Local Examination Boards are set up for the three departmental examinations, viz., Joint Primary 6, English School Certificate, Chinese School Certificate. Each of the three boards is autonomous and administers its respective examination.

Supervision and inspection. Inspectors are chosen from among government teachers who have had considerable teaching experience in schools or have been lecturers in training colleges. The academic and professional qualifications of inspectors vary from a teacher's certificate awarded after two years' full-time study at a training college to a university honours degree with a teaching diploma.

The Assistant Director of Education (Inspectorate) is the Chief Inspector of Schools and he is assisted by 3 senior education officers and 77 others inspectors for all schools in Hong Kong. Where technical schools are concerned, the Chief Inspector may request the assistance of the Principal of the Technical College who is the advisor to the Director of Education on technical education. In addition there are a few inspectors who are maintained and controlled by Her Majesty's Forces for the purposes of supervising schools under that authority.

In so far as secondary schools are concerned, area inspectors are responsible for advising the supervisors and heads of private Chinese secondary schools on such matters as syllabuses, time tables, textbooks, administration and the improvement of educational standards. One section of the inspectorate is specifically responsible for private

Anglo-Chinese secondary schools throughout the Territory, while another deals with subsidized Chinese secondary schools. There is also a group of subject advisers including inspectors for Chinese, English, mathematics, science, geography, history, art, domestic subjects, and handicrafts, an organizer of physical education, and an organizer of music. One senior education officer advises on the education of girls, the general welfare of women teachers, and the administration of girls' schools.

The inspectorate assists with the preparation and revision of suggested syllabuses, one inspector being full-time secretary of the Syllabuse and Textbook Committee, and the remainder being representatives of the Department on the various sub-committees. The inspectorate also produces pamphlets on teaching methods, edits bulletins on the teaching of Chinese, English and mathematics, and organizes short training courses and conferences for practising teachers. All translation from English to Chinese and vice versa is handled by the inspectorate.

Inspectors act as examiners and markers for departmental examinations and have a special responsibility for the organization of the Chinese School Certificate examination and the Joint Primary 6 examination.

Finance. All funds for government and aided schools are raised from current government revenue, and payments made in accordance with approved financial estimates. Payment to schools varies with the three main categories of schools.

Government secondary schools. These schools are completely controlled by the Department of Education, and all financial matters are dealt with by an accounting section of the Department. Expenditure is detailed in the government estimates, and is split into Personal Emoluments and Recurrent Expenditure, the former covering salaries and allowances of all government teachers, and also certain travelling expenses and pensions. All capital works, and non-recurrent expenditure on buildings, furniture and equipment is financed in the estimates from the Public Works Department, and the expenditure is incurred on the advice of the Education Department. Minor equipment is purchased from the Education Department estimates.

All government schools charge fees, which in secondary schools vary from $HK.120 to $HK.240 per annum, and are payable in 10 monthly instalments. The fees at secondary technical schools are $HK.120 per annum. The fees charged represent 17 per cent of the expenditure on recurrent educational costs only.

Assistance to parents is given in the form of free places (up to 30 per cent of the total enrolment), scholarships (awarded by the Government from scholarship funds or awarded from private sources), maintenance grants for deserving pupils in the matriculation classes, i.e., form 6 of Anglo-Chinese schools, who are in need of the money to complete their studies.

Grant-in-aid secondary schools. Various salary scales (mainly as for government schools), are authorized for teachers in grant-in-aid schools. Appointments and promotions are approved, and salaries assessed by the Government, having regard to qualifications, experience, efficiency and suitability. Fees range from $HK.250 to over $HK.500 per year depending upon the school grade. Provision is made for up to 30 per cent of the total enrolment to enjoy free places. A provident fund is established for the teaching staff. The administration of the fund is controlled by a board, consisting of representatives of both the Government and the schools concerned.

Subsidized secondary schools. Annual tuition fees charged in secondary subsidized schools range from $HK.40 per pupil to $HK.240 per pupil. Tuition fees are taken into account in arriving at the recurrent subsidy. Besides tuition fees, subsidized schools are allowed to charge supplementary subscriptions at rates approved by the Government. This source of income is normally not taken into account to calculate the recurrent subsidy, but is used by schools to defray the other part of capital expenditure not met by the Government. Salaries paid to teachers are the same as in grant-in-aid schools, but no provident fund is established for the staff.

Private secondary schools. Private schools may apply for government grants to pay for the rates and for architects fees for the examination of the structural safety of the school. Non-profit-making private schools are also eligible for grants of building sites on concessionary terms and for interest-free building loans.

Building and equipment. An attempt has been made to produce a standardized government secondary school, which will serve as an example for non-government schools. The standard school is erected on a plot of 50,000 square feet, and contains 24 classrooms, specialist rooms and ancillary rooms. There are detailed regulations covering lighting and sanitation.

School welfare services. The Government provides a school medical service and a school dental service. At present the number of schools which can participate in these services is limited. Treatment is given when necessary in government health and dental clinics without charge, and hospitalization is available for serious cases. Government school pupils pay $HK.5 a year for these services, aided schools $HK.5 a year, and private school pupils $HK.15 a year. In grant-in-aid schools a great deal of welfare work is done for needy pupils both in the school and outside.

TYPES OF SECONDARY EDUCATION

At the end of the primary school course a Joint Primary 6 promotion examination is held in which all government schools compete, together with most grant-in-aid schools, and such subsidized and private school pupils as have reached a sufficiently high standard. Pupils who are over-age for competing for the Joint Primary 6 examination or not of sufficiently high standard may enter private secondary schools. Any pupil who leaves school because he is over-age or has financial difficulties can continue in night schools or evening classes at a secondary level. In addition pupils can enter vocational schools where the medium of instruction is Chinese, or the junior technical schools where the medium of instruction is English. No official form of guidance is given for selection of the type of secondary education to be followed by a pupil when he leaves the primary school.

The secondary school year begins in September and finishes in July. The summer holiday at the end of the year is the longest holiday. Shorter holidays are given at Christmas, Chinese New Year (about early February) and Easter. The academic year with one or two exceptions is divided into two terms, the Chinese New Year holiday being the dividing line. The school week consists of five working days, and the school day is normally from 9 a.m. to 4 p.m.

General secondary schools

Anglo-Chinese schools. In these schools, the aim is to provide a broad general education in academic subjects taught in English, although the study of Chinese is also encouraged so that pupils leave school with a working knowledge of both cultures. A 5-year course (forms 1 to 5) leads to the Hong Kong School Certificate, in which pupils must pass in selected subjects at one and the same time in order to qualify for a certificate. Pupils then leave for suitable employment or enter a teacher training college or proceed to form 6. This latter course lasts for 2 years and ends with the London University General Certificate of Education, or with the University of Hong Kong Matriculation examination, which qualifies pupils for entrance to British Commonwealth universities.

Pupils are admitted on the basis of the Joint Primary 6 examination, and come from both Chinese-medium and English-medium schools. The pupils in a government secondary school need not necessarily come from a government primary school but must take the Joint Primary 6 examination. Grant schools admit secondary pupils under two schemes: under Scheme A, 67 per cent of the entrants to form 1 are accepted from the Joint Primary 6 examination and 33 per cent of the places are filled at the discretion of the head of the school; under Scheme B, schools make their own selection up to 70 per cent and the remaining 30 per cent is filled by pupils selected through the examination. Subsidized and private schools enter selected pupils for the examination; such schools are only allowed to enter pupils if the academic standard warrants it.

In government and grant schools, there is streaming by academic ability but the remaining schools prefer to stream by ability in English, or tend to group pupils by the date of entry into a school. This is necessary as pupils reach school with varying abilities to cope with lessons in English. At the fourth year of the secondary course, pupils are allocated to arts or science courses, according to their performances in examinations. Most Anglo-Chinese schools have a half-yearly terminal examination as well as a promotion examination at the end of the year. Pupils are promoted, retained or rusticated on the promotion examination.

The subjects in the curriculum are English language, literature, Chinese language, history, geography, civics, mathematics, physics, chemistry, biology, art, music, physical education, domestic science, and Biblical knowledge in schools with missionary influences. Commercial subjects are taught in some classes as special subjects, or in a post-secondary class. The normal academic subjects are taught to School Certificate standard.

The organization, curriculum, syllabuses, and methods of teaching in Anglo-Chinese schools are modelled on current education patterns in England, modified where necessary to suit local conditions. This means that particular textbooks, suitable for England, are not necessarily suitable for Hong Kong.

School report cards are maintained by all schools, although no standard technique exists. Promotion depends more upon examination than upon the report card, which usually details the results of the examination.

The teaching staff in government secondary schools is recruited from various universities, and also from the 2-year training course at Northcote Training College (Hong Kong). The university material varies considerably in its background and academic attainment. Graduates are generally recruited as assistant education officers. Assistant education officers can be promoted to education officers, and as such are eligible for headships of schools, eventual appointment to the inspectorate, or to administerial posts, rising to senior education officers. The two-year trained teachers begin as certificated teachers on the time scale. In grant schools, the same system is followed except that there are no education officers; hence a teacher can only achieve a senior position on the staff, or perhaps a headship, if he enters government service. In subsidized schools, the same rates of pay are given as for the other two types of schools, but the teachers receive no provident fund as in grant schools, nor pension as in government schools. In private schools, the rates of pay tend to be low and the schools recruit whoever is available at the price they are prepared to pay.

Chinese schools. The aim of the Chinese school is to give a general education based on Chinese culture with the addition of some Western knowledge, and to teach English as a second language. A 6-year course leads to a Chinese School Certificate.

Pupils enter Chinese secondary schools from Chinese primary schools, and there is usually an entrance examination. Children are not usually grouped according to general ability, but according to their proficiency in the Chinese language.

All schools have a prefect of studies in charge of academic subjects, and, in the larger schools, the teaching of each subject throughout the school is organized by a dean. In all but the smallest schools there is also a dean of discipline, who maintains order. The headmaster deals with administrative matters and does not carry out actual teaching duties although he may be a qualified teacher. The school is run by a board of managers, acting for philanthropic, public spirited, or financial reasons. The supervisor, who is one of the managers, is officially in charge of the school, and is the administrative link between the school and the Department of Education; among other duties he engages and dismisses teachers in conjunction with the Department. In the larger schools there is a prefect of general affairs, a teacher appointed to conduct the routine business of the school, e.g., collection of fees. It will be seen that the functions of a teacher in such an organization may differ from those of a teacher in an Anglo-Chinese school; the system is the traditional Chinese one. These remarks do not apply to government schools or schools which are conducted in the same way as government schools.

The schools compile reports on pupils in detail and hold examinations twice a year. Pupils at the end of their 6-year course enter for the Hong Kong Chinese School Certificate. Successful pupils are admitted to Chinese post-secondary colleges, to the School of Higher Chinese Studies at the Evening Institute, or to the Special Classes Centre.

The teaching staff has been largely recruited from universities in Taiwan and mainland China but it is expected that the recent growth and development of the post-secondary colleges will supply secondary teachers in the future. Teachers in the schools can expect to progress to the posts of deans or prefects, and finally headmasters. Chinese secondary schools are mainly private schools. There are a few government schools, some Chinese departments of grant-in-aid secondary schools and a few subsidized schools.

The Special Classes Centre. This centre gives a 2-year course in English to pupils who have completed courses in Chinese secondary schools. As only 60 places are available, competitive tests are held to select suitable candidates. Many of the centre's students, having passed in English language but not having completed all the five subjects required for matriculation, continue their studies in Anglo-Chinese schools in the hope of entering the University of Hong Kong. About half of the candidates who pass the School Certificate English language paper after their first year of study do not proceed to the second year but continue their studies in one of the teacher training colleges.

Evening Institute. This comprises three sections, viz., the Evening School of Higher Chinese Studies, English language classes, and classes in academic and practical subjects for teachers. The institute is organized by the Education Department, and is financed by government funds. Instructors are recruited from all members of the teaching profession, and from outside the profession as well.

The Evening School of Higher Chinese Studies was founded in March 1951. The aim of this school is to provide education in the Chinese medium at post-secondary level to men and women who have passed the Hong Kong Chinese School Certificate examination or its equivalent. There is an entrance examination for which certain exemptions are provided. The school now offers two courses of study—general arts and commerce—each being a 3-year course leading to a diploma issued by the Education Department.

Vocational and technical schools

Technical and vocational education in Hong Kong roughly follows the United Kingdom pattern. At the apex of the pyramid is the University of Hong Kong which, in its Department of Engineering, provides degree courses in civil, mechanical and electrical engineering. These courses, being at technological and not technical level, are not referred to further in this text. There is close co-operation between local industry and the various technical and trade schools.

Agriculture, forestry and fisheries. Short courses for skippers, coxswains and engineers of fishing vessels are provided by the Department of Agriculture, Forestry and Fisheries. The courses are entirely vocational and bear directly on the needs of the fisherfolk. Agricultural education is provided by the same Department, mainly in the form of visits and lectures to small groups but 6-week courses of practical farm training for young farmers have recently been introduced.

Domestic science and careers for girls. Nearly all the girls' secondary grammar schools in Hong Kong provide instruction in domestic science but the Ho Tung Technical School lays much greater emphasis on this subject with the aim of training girls for careers as teachers of the subject or for employment in hotels and hospitals. This school also teaches housecraft, needlecraft, pottery, toymaking, fabric printing, window dressing and home nursing; all these are designed to prepare girls for direct entry into employment. The proportion of time devoted to vocational subjects rises from about 25 per cent of the school week in the first year of the course to about 40 per cent in the fifth year.

The Po Kok School is a primary and secondary school with a strong bias towards vocational subjects, principally needlecraft and commercial subjects. About 30 per cent of the students' time is given to technical subjects. There are some five or six private schools offering short concentrated courses in dressmaking or embroidery.

Many of the girls' secondary schools in the Colony have a sixth form in which commercial subjects are taught, mainly shorthand and typing.

The Government Technical College. All Departments have day and evening classes. All full-time classes are taught in English and applicants for admission are required to have a general education to School Certificate level. The number of applicants is in excess of the places available and a competitive entrance examination is held in August of each year.

The various departments of the college and courses offered are as follows:

Building. A full-time 3-year course, the subjects taught being building construction and drawing, field surveying, structural engineering, organization and management and book-keeping. About half of the time is spent in practical work such as carpentry, joinery, bricklaying and surveying. Four months of each school year are spent in full-time attendance at building sites for practical training. The Department also offers a 3-year 'sandwich' course for Building Contractors' Apprentice Foremen and a part-time day course in building construction for Health Inspectors.

Commerce. Two 1-year full-time courses, one concentrating on book-keeping and the other on secretarial work, shorthand and typing.

Mechanical engineering. A full-time 3-year course, the subjects including heat engines and internal combustion engines, technical drawing and machine design, production engineering and electro-technology. Students spend approximately half their time in the workshops and laboratories. From each class, a few students go to England for student-apprenticeships with large engineering firms. Part-time day release classes for engineering apprentices are also provided by this Department.

Electrical engineering. Courses for radio officers and

telecommunications technicians. Mathematics and science, woodwork and metalwork, electrical and radio technology, and technical drawing form an all-round course in which the students spend half their time in practical work.

Navigation. Short courses for Masters', Mates' and Second Mates' Certificates of the Marine Department, radar observers' courses and a pre-sea training course.

Textile industries: a 3-year course in weaving and spinning, testing and dyeing with about 50 per cent of the time spent on practical work.

The day departments of the college are also responsible for related evening courses in regard to curricula, staffing and equipment. The lecturers are from the staff of the Technical College, the Victoria Technical School and other government institutions, and from local commercial and industrial firms.

The technical courses are divided into senior and advanced sections. The senior course requires 3 years' study and leads to the College Ordinary Certificate, comparable with the ordinary National Certificate (United Kingdom). The advanced course requires a further two years' attendance and prepares for the Higher Certificate, equivalent to a Higher National Certificate (United Kingdom). Preliminary courses in building and engineering are intended for those students whose basic education is not up to the standard for entry to the senior technical classes. The duration of the book-keeping and the shorthand courses is 3 years. In the majority of these courses, the medium of instruction is English but since September 1955 a number of technical classes have been conducted in Cantonese.

Victoria Technical School. This school is equipped with large woodwork and metalwork shops, a small foundry, laboratories for chemistry, physics and applied mechanics, several drawing offices, music room, library and an adequate number of classrooms. The curriculum is that of a secondary technical school in which a general education is added to vocational training in woodwork, metalwork, technical drawing and workshop technology. About 25 per cent of the student's time is given to technical subjects.

Aberdeen Trade School. The school has a primary section and an apprentices' section where three trades are taught—mechanics, electro-mechanics and carpentry. For many years the school has provided a complete apprenticeship training of five years' duration and produced competent craftsmen, immediately available for employment as improvers or artisans. Many employers, however, prefer to recruit at the apprentice stage and the school will now meet this need and provide a more complete education through a secondary technical school stream leading to the Hong Kong School Certificate. The boys spend some 30 per cent of their time in the workshops and a good deal of production work is undertaken.

Tang King Po School is situated in Kowloon and provides trade training for apprentice printers and bookbinders, tailors and shoemakers.

Teacher training

Two training institutions offer three different full-time courses: (a) a 2-year course producing a certificated teacher capable of teaching in upper primary or lower secondary schools; (b) a 1-year course producing a trained primary school teacher: (c) a special 1-year course for successful students from the post-secondary colleges, which qualifies the students to teach in secondary schools as non-graduates. In addition there are part-time courses of in-service training for untrained teachers.

The curriculum of the above courses includes: language study, either English or Chinese; basic professional subjects (a) principles, psychology and practice of education, (b) health education; teaching practice; two to four optional subjects chosen from mathematics, science, geography, history, handicrafts, art, music, physical education and domestic science (at least one must be academic and at least one of a practical nature). Besides their academic studies, students are required to take part in the usual extra-curricular activities such as dramatics, debates, athletics, etc. In the 1-year primary teachers' course, the instruction is less theoretical than in the 2-year course, as time does not permit a deep study of the subjects, and the teachers are urgently needed in the primary school expansion programme. The level of study in the 2-year academic course is slightly above the accepted secondary level, but does not approach university level.

Out-of-class activities

Pupils participate in school government through the prefect system and through school clubs and societies. Schools also have committees composed of pupils who discuss the spending of funds raised from additional fees paid.

Sports facilities in schools vary greatly. Inter-school competitions are organized in athletics, badminton, basketball, boxing, association football, hockey, swimming, tennis, etc.

A rapid expansion of cultural activities in the schools has occurred during the last few years. The Hong Kong Festival of the Arts incorporates school performances in music, drama, and art, and the Schools Music Festival attracts competitors in ever-increasing numbers. An inter-school dramatic competition is organized by the Education Department, and once a year plays are performed in both English and Cantonese.

Numerous school societies exist for all forms of cultural activity including those organized by religious bodies. There are active Boy Scouts and Girl Guides associations.

TRENDS AND PROBLEMS

The present trend of secondary education is an ever-increasing expansion of facilities. Owing to increased primary enrolments, a large demand for secondary places will be created in three to four years' time. It has been decided to tie expansion of the present academic system to the proportion of the population which would benefit from this type of education. However, primary school children must continue their education until they have reached an age for work and the Department is considering a new type of junior secondary school to assist in meeting the demand for secondary education. No details have been fixed as yet.

The two main problems of the Department are space for building and the size of the population. Hong Kong is already highly urbanized, and very little space exists for future school buildings. Much ingenuity has been shown in developing difficult sites, previously barred owing to the nature of the terrain, but even such sites will become scarce in the future. The second problem is caused by the influx of refugees into the territory. The local population itself undergoes the rapid increase associated with Asia; when an influx of refugee children is added the problem becomes almost insurmountable. Finally finance is restricted owing to the territory's limited capacity to produce an income. These facts explain why the present system has evolved as a means of supplying the maximum education within the financial resources available.

STATISTICS

Population (mid-year 1958 estimate): 2,748,000.
Area: 391 square miles; 1,013 square kilometres.
Population density: 7,028 per square mile; 2,713 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 total enrolment in schools and colleges including evening classes was nearly 278,500 students representing 11 per cent of the total population. Of the total enrolment, 79 per cent was in primary schools, nearly 18 per cent in general secondary schools, 2 per cent in technical schools and the remainder in teacher training colleges and university courses. Girls made up over 41 per cent of primary and general secondary school enrolment and were well over half the enrolment in teacher training courses. At university level, however, girls represented only 27 per cent of those enrolled. The total teaching staff in primary and secondary schools numbered over 11,800 of whom 49 per cent were women. Compared with 1953/54, enrolment in primary schools had increased by 77 per cent, in general secondary schools by 28 per cent, in technical schools by 38 per cent, in teacher training colleges by 379 per cent and in universities by 295 per cent. The average pupil-teacher ratio in primary schools in 1957/58 was 25 compared with 20 in 1953/54, the corresponding figures for secondary schools being 18 and 15. (See Table 2.)

Examination results in secondary education, 1953–57. The number of passes in the General Certificate of Education examination increased by 160 per cent between 1955 and 1957. The Chinese School Certificate was awarded to 1,194 students in 1957, an increase of 72 per cent compared with 1953. The output of trained teachers also increased steadily over the period under review. Technical examinations are incompletely reported but certificates were awarded to 804 students in 1957 compared with 658 in 1955. (See Table 3.)

Educational finance, 1957/58. Total public expenditure on education in the fiscal year beginning April 1957 amounted to 65.1 million Hong Kong dollars, or about $25 per inhabitant. Details of the substantial expenditure on education made by bodies other than the Central Government are not available. Capital expenditure ($12,203,930) was 19 per cent of the total spent by the Government. The distribution of recurring expenditure by level and type of education is given in Table 1.

1. Including 175 attending evening schools for English language only.

2. There are also examinations held by the Marine Department, General Post Office and the Associated Board of the Royal School of Music.

NORTH BORNEO

North Borneo occupies the northern corner of the island of Borneo. It was formerly administered by the British North Borneo Company under royal charter but in 1946 the sovereign rights and assets of the company were transferred to the Crown. The island of Labuan, which lies six miles off the north-western coast of Borneo and which had previously been administered separately, was included in the new Colony. The Governor is assisted by a Legislative Council and an Executive Council.

The native inhabitants of the Colony are Dusuns, Bajaus, Bruneis, Muruts, Suluks and several smaller tribes; these peoples speak languages akin to Malay. The largest non-indigenous group are the Chinese, who make up nearly one quarter of the total population. The official languages of the country are English and Malay.

THE EDUCATIONAL SYSTEM

Education is provided in state schools and independent schools. State schools are entirely maintained and controlled by the Government; they are nearly all Malay-language primary schools but they include a few primary and post-primary institutions where English or Chinese is the main medium of instruction. In some areas local authorities have assumed a measure of responsibility for the operation of government primary schools. The two largest groups of independent schools are those run by the Christian missions and by the committees of Chinese communities throughout the colony. Both groups offer primary and secondary education. Mission schools for the most part use English as the medium of instruction, while most teaching in the Chinese schools is in Mandarin, although English is a compulsory subject. There are also a few native voluntary schools providing primary education in Malay or English in communities where state schools have not yet been established, and some estate schools established by the management of commercial undertakings for the children of their employees. The Government assists independent schools with grants-in-aid to help meet building costs and recurrent expenditure. Most independent schools charge fees. Compulsory education has not yet been introduced.

The principal executive officer of the Government is the Chief Secretary. The Director of Education, as head of the Education Department, is responsible to the Chief Secretary for the general control and supervision of the educational system. He exercises this authority by virtue of the Education Ordinance No. 164 of 1956, which consolidated and amended previous legislation. *Inter alia* the ordinance requires the registration of all schools, school managers and teachers, defines the rights and duties of those concerned with education and provides for the inspection of schools. The Education Regulations 1957, drawn up under the ordinance, cover school premises, health and sanitation, discipline, fees, holidays, grants-in-aid, school records and accounts, etc.

The Colony is divided into 15 school areas, each having its own local education committee drawn from persons representing the whole range of educational interests of the community.

In matters of educational policy for all levels and types of school, the Government is advised by a Board of Education established in 1956 to replace the Advisory Committee created under the 1954 ordinance. The board is composed of seven senior government officials, three legislative councillors, three representatives of the missions, two men and two women teachers, and ten persons who are members of local education committees.

Government expenditure on education is financed from the ordinary budget of the Colony and from the development budget (mainly for constructing new schools). Expenditure by voluntary agencies is financed mainly by grants received from the Government, by income received from school fees and by collections and subscriptions.

The duties of the administrative staff of the Education Department include inspection of all types of schools and of teachers, arrangements for examinations, demonstration lessons, general advice and encouragement.

The basis of the school system is a 6-year primary course for children in the 6–12 years age group. Primary schooling has three major divisions—Malay, English and Chinese language education. Although the content and standards of these types of school varied greatly in the past they are now becoming more uniform. Post-primary education is selective. In the English medium it is provided in secondary schools either with 5- or 6-year 'full' courses or with 3-year 'junior' courses. Chinese secondary education, provided in 'middle schools', comprises a 3-year junior middle course followed, in the principal towns, by a 3-year senior middle course. Pupils who have completed a Malay or Chinese language primary course may transfer to English-medium education by entering special English preparatory classes of one or two years' duration which are attached to some secondary schools. Pupils from all types of primary school may enter the trade school, which offers a 2-year course. Various kinds of vocational training and apprenticeship schemes are provided by other government departments. The minimum educational qualification for entry to the teacher training college is three years' successful secondary schooling for the English- and Chinese-medium sections, and six years' primary schooling for the Malay section. There are no institutions of higher education.

THE DEVELOPMENT OF SECONDARY EDUCATION

After World War II secondary education expanded rapidly, the number of pupils rising from 93 in 1947 to 1,607 in 1953. At a time when the most urgent task of the authorities was to develop primary education as a sound basis for the whole system, this growth of secondary schools was a matter for some concern. Of the few trained primary teachers available the best were often transferred to secondary classes, and other resources were similarly diverted. Even then there were not enough teachers competent to teach the academic type of secondary course which alone was provided, and the education in some schools was secondary only in name. For some time therefore the Education Department discouraged the unplanned and inadequately prepared spread of secondary education.

In recent years the situation has improved. Since the opening in 1952 of Kent College, a teacher training college at Tuaran, there has been an increasing number of qualified primary teachers trained in methods suited to the needs of the Colony. The improvement in the quality of primary education and the great increase in the number of children completing the primary course created a justifiable demand for the extension of secondary education.

In order to ensure that new secondary schools established in response to this demand should be of a satisfactory standard, the Board of Education studied the problem during 1957 and laid down certain conditions which school managements have to fulfil before opening secondary courses. These conditions require that there should be a minimum number of qualified pupils wishing to enter the course (15 for a 3-year or junior course, 18 for the 5- or 6-year or full secondary course), minimum staffing arrangements, and suitable accommodation. The opening of a junior course must have the approval of the local education committee and the Director of Education, and the opening of a full secondary course that of the Board of Education;

in either case the course must be accepted for registration under the ordinance. Finally, the opening of a secondary course must in no way be detrimental to the quality of work in the primary department.

The above conditions apply to both English- and Chinese-medium schools. A further step towards uniformity in the provision of secondary education has been the issuing of departmental syllabuses for the junior secondary course in both types of school with a view to ensuring that the same standard is reached regardless of the language of instruction. Similarly, there is now a common external examination for all pupils who complete the junior secondary course. This examination, as well as the primary leaving examination, is set by the North Borneo Examinations Board comprising representatives of all the different types and levels of school, the training college, and the Education Department.

In 1957 the first government secondary school was opened at Jesselton. This school is intended mainly for selected native pupils from rural areas and pays particular attention to the teaching of science classes to enable pupils to matriculate at overseas universities. Most of the independent secondary schools are attached to primary schools, and the question of the administration of secondary education is covered by the information given in the preceding section on the educational system as a whole.

The number of pupils enrolled in secondary schools in 1958 was 3,019.

TYPES OF SECONDARY EDUCATION

General secondary schools

The educational qualification for entry is the completion of six years' primary schooling; selection of pupils is guided by the results obtained in the external North Borneo Primary Six examination. As described above, some English secondary schools have preparatory language classes for pupils seeking to enter from schools using other media.

The policy in respect of the junior secondary courses is that these should provide a reasonable basis of general education coupled with an aptitude for environmental pursuits. The syllabus of the Junior Certificate examination has been made sufficiently wide to cater for this, but difficulties in training specialist teachers and in providing workshops and equipment restrict the present development of this policy.

The full secondary course has been adapted to the syllabus of the Cambridge Oversea School Certificate examination, and an improvement in the recruitment of science teachers and in the equipment of laboratories has resulted in all the larger schools including science in their curricula. A special effort is now being made to provide good facilities for instruction in home economics for girls.

Emphasis is also being placed on the development of physical education and of games and a number of teachers are receiving special training for this overseas.

Reference has already been made to the institution of a post-School Certificate science course to prepare pupils for university entrance, and an effort is now being made to establish a post-School Certificate arts course for the Colony in a mission school in 1960. The new government school at Jesselton has a bias towards science and has facilities for practical instruction in woodwork, metalwork and domestic science.

Increased attention is being given to bilingualism, i.e., the teaching of English in Chinese schools and of either Chinese or Malay in English schools. For the junior (3-year) course, both English and Chinese schools now use syllabuses prepared by the Department and prepare pupils for the North Borneo Junior School Certificate. The long course in English schools prepares for the Cambridge Oversea School Certificate, and in Chinese schools for the Senior Middle School Certificate, though it is hoped that pupils from the Chinese schools will soon be sufficiently proficient in English to enter for the Cambridge examination. Scholarships for higher education overseas are granted by various bodies.

Extra-curricular activities include all standard team games and athletics, badminton, etc. Inter-school competitions are held. Recreational activities, such as stamp clubs, chess clubs, Boy Scouts, Girl Guides, and first-aid groups, are also encouraged. The Education Department has encouraged the development of libraries, especially for secondary schools. The Department of Broadcasting and Information also provides libraries, including the book-box system for outstations, educational cinema shows and radio programmes.

Teachers holding senior posts in English secondary schools are usually expatriate staff. Recently, selected secondary graduates have been sent to universities and training colleges overseas to prepare for a career in secondary teaching and some of these are now returning. In the past, teachers in Chinese secondary schools have had to be recruited from overseas. It is now planned to staff these schools with North Borneo Chinese, and a number of successful middle school pupils have been sent to Hong Kong for college training.

Vocational and technical schools

The government trade school in Jesselton offers 2-year courses in carpentry or motor mechanics and a 2½-year course in electricity. Subjects taught include mathematics, machine drawing and English. The school is well equipped with lathes, tools and sectionalized apparatus.

The Public Works Department offers apprentice training and higher-level courses for technical assistants. After initial training the latter are sent at the Department's expense to the Kuala Lumpur Technical College, Federation of Malaya. Courses in welding and locomotive maintenance, etc., are conducted by the North Borneo Railway. The Forestry Department trains its own forest guards. Courses in general and mental nursing, midwifery and public health are provided by the Medical Department; apprenticeship training for artisans in shipbuilding and marine engineering, by the Marine Department; and overseas and local training for air traffic control assistants, by the Civil Aviation Department.

Teacher training schools

The training college at Tuaran still accepts Malay-medium

students whose educational qualification is Primary 6. In all cases these students have had some experience as practising teachers. It is hoped soon to bring the entrance requirement into line with that for English- and Chinese-medium students, so that all teacher training will be at post-junior secondary level.

TRENDS AND PROBLEMS

In addition to the urgent problem of providing universal primary schooling, the Education Department is concerned with planning the expansion of secondary education so that a proper balance is maintained with other types and levels of schooling, and so that the education provided is in relation to the needs and resources of the country. It is intended to make provision in a few selected rural areas for central schools where academic instruction will be supplemented by vocational interests, and in particular by the formation of Young Farmers' Clubs.

The demand for new textbooks written especially for North Borneo pupils has so far resulted in the production of three books on social studies. In this respect and in the fields of curriculum planning and administration the Department is continuing its efforts to bring the three different language systems into a national school system. Thus, while catering for the different needs and backgrounds of a multi-racial society, the system will maintain uniform standards and turn out people who will recognize themselves as fellow-citizens of North Borneo.

A matter of particular interest is a widespread demand for the use of English rather than Malay in rural primary schools. Although of fairly wide application as a lingua franca, Malay is not the mother-tongue of the great majority of the indigenous peoples, and these peoples believe that their children must have a sound background of English if they are to progress. Accordingly, the Department has drawn up plans, with the help of outside agencies, to endeavour to convert the government primary schools to the medium of English over the next five years.

[*Text revised by the Director of Education, Jesselton, in June 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 409,000.
Area: 29,388 square miles: 76,115 square kilometres.
Population density: 14 per square mile; 5 per square kilometre.

Summary of school statistics, 1953–57. In 1957 there were 300 schools at primary and secondary levels with a total enrolment of about 34,250 pupils, representing approximately 9 per cent of the total population. The proportion of girls enrolled in primary schools was 37 per cent, and in secondary schools 30 per cent. The number of primary school teachers was about 1,040, of whom 35 per cent were women, and the average pupil-teacher ratio was 30. The pupil-teacher ratio in general secondary schools was 25. (See Table 1.)

Examination results in secondary education, 1953–57. In 1957 candidates for the Cambridge Oversea School Certificate numbered 124, including 20 girls, compared with 31, including only 1 girl, in 1953. There were, in addition, 113 candidates for the Chinese Junior Middle School Certificate and 15 candidates for the Chinese Senior Middle School Certificate in 1957. The North Borneo School Leaving Certificate was instituted for the first time in 1957 with 17 successful candidates of whom 2 were girls. In 1957, 71 students successfully completed teacher training.

Educational finance, 1957. Total expenditure for education in the fiscal year beginning January 1957 was 5,131,450 Malayan dollars or approximately $12.8 per inhabitant. Of this total, 43 per cent came from territorial revenue, 16 per cent from United Kingdom funds, 2 per cent from local authorities, 13 per cent from voluntary agencies and the remainder from Chinese school boards and the Liberation Educational Trust. Capital expenditure amounted to $1,456,270 or 28 per cent of the total spent. (See Table 2.)

Sarawak lies in the north-western part of Borneo. The coastal region is a swampy alluvial plain and communications are provided for the most part by river transport. The country is sparsely populated by peoples of different origins, languages and cultures and at different stages of economic and social development. The indigenous population is made up of Sea Dayaks and Land Dayaks, the Malays and Melanaus, and a number of small groups such as the Kayans, Kenyahs, Muruts, Kelabits and Bisayas: these peoples speak distinct but related languages. Among the non-indigenous inhabitants the Chinese are by far the largest group, comprising about 30 per cent of the total population. The official languages of the country are English and Malay. There is no lingua franca, although Malay is widely understood.

Originally the southern province of the Brunei sultanate, Sarawak became in the nineteenth century an independent state with a British subject as Rajah. This form of government, in which the Rajah was assisted by British administrators, continued until 1 July 1946 when Sarawak was ceded to the British Crown and a Governor was appointed. The constitution grants legislative and financial jurisdiction to the Council Negri.

THE EDUCATIONAL SYSTEM

The Constitution Ordinance of the Colony provides for the development and improvement of educational services. The Education Department itself directly maintains and manages only a small number of schools, its chief contribution to the provision of educational facilities taking the form of aid to local authorities and voluntary agencies. Local government schools are mostly primary schools for the indigenous peoples, in which the vernacular is used in the lower grades and English in the higher. The principal voluntary agencies providing education are Christian missions, Chinese boards of management and village committees. The missions have rural schools for non-Malay indigenous pupils which resemble the local authority schools in curriculum and medium of instruction; nearly all their urban schools teach in English, but a few use Chinese. The schools established by the Chinese community use Kuo-yu as the teaching medium. 'Village committee' schools are native primary schools. There are also a few private schools run by trading companies for the children of their employees.

The Director of Education, who exercises general control over the whole system, is assisted by an advisory committee and may also appoint *ad hoc* committees to investigate and report on particular aspects or problems. Administration is regulated by the Education Ordinance 1950, which provides for the registration of schools, managers and teachers, and for the inspection of schools by officers of the Education Department. It has not yet been found practicable to introduce compulsory education. Although tuition fees are charged in both primary and secondary schools, the rates in aided schools are fixed by the Department and in certain cases may be remitted. A number of scholarships are also available.

All non-government schools which meet the conditions laid down in the Grant Code (Regulations) 1956 receive financial assistance. This means that their approved recurrent expenditure, after deduction of income received from fees, is met in full from government funds. For approved capital expenditure half the cost is met by the Government and half by the school management. Expenditure on recurrent grants to schools is met from the annual budget of the country but capital grants are paid from the development plan fund.

The normal minimum age for starting primary school is 6. The full course lasts 6 years and is divided into 4 years of lower primary (primary 1–4) and 2 of higher primary (primary 5–6). The secondary course is divided into junior and senior stages. In English-medium schools the former comprises forms 1 to 3 and the latter forms 4 to 6, the sixth form being divided into lower and upper. In the Chinese language system secondary schools are called middle schools and the classes are known as junior middle 1, 2 and 3, and senior middle 1, 2 and 3. There are teacher training centres which provide 2-year courses at two levels: at the lower level most entrants have had some secondary schooling and the higher level have completed a full secondary course of 5 or 6 years.

A regular schools broadcasting service began in 1959. Its first aim is to assist untrained or poorly trained teachers in remote primary schools, where supervision is difficult because of communications, but expansion of the service to include other primary schools and eventually secondary schools is planned.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education has been in the past, and still is, almost entirely in the hands of the Christian missions and the Chinese school boards. The curricula, textbooks, general orientation and discipline of the mission schools and the Chinese schools differ widely and one of the main problem for the authorities is how to bring about unity in aims without destroying the distinctive character of the different types of schools.

Until 1956 the only government institutions at secondary level were a junior secondary school for Malay pupils in Kuching, the capital, and a teacher training centre at Batu Lintang to which were attached some academic classes for selected boys of the indigenous races. In that year, however, government policy in regard to secondary education was reconsidered. The chief factor influencing the authorities was the need to provide secondary education

for the increasing number of pupils in the interior of the country who complete the primary course. The principal secondary schools run by voluntary agencies are situated in urban areas, and while mission schools have limited accommodation for boarders, Chinese middle schools usually have none at all. Moreover, voluntary agencies have found it difficult to finance the building and equipment of new secondary schools.

It was therefore decided to establish new secondary boarding schools for boys and girls of all races living mainly in rural areas, and the allocation of funds for the establishment of a nucleus of such schools throughout the country was approved in 1956. The first of these, the Tanjong Lobang school, began to function in 1957, a second was opened at Kanowit in 1958 and a third at 24th Mile on the Kuching-Serian road in 1959.

In 1957 the Government also opened a new teacher training centre at Sibu, for teachers in Chinese schools. Both the Batu Lintang and Sibu centres are residential and admit men and women students.

A Supervisor of Technical Education was appointed in 1958 to develop this branch of training.

TYPES OF SECONDARY EDUCATION

General secondary schools

English-medium schools. Since 1957 there has been a common entrance examination for all English-medium schools. On the results of these examinations pupils are divided into two groups, 'selected' and 'unselected'. The former study for the recognized examinations (or will enter technical courses when these are organized); 'unselected' pupils do not have to take the examinations and more suitable courses are being devised for them.

Some secondary schools provide only a 3-year course leading to the Sarawak Junior Certificate examination. The larger schools prepare for the Cambridge Oversea School Certificate examination, which is taken in the fifth form, and a few have sixth forms where candidates are prepared for the Cambridge Higher School Certificate and university entrance. The curriculum is academic, and before World War II was purely literary. The syllabus for the Sarawak Junior Certificate now includes general science, woodwork, metalwork, needlework and cookery, and some schools have science laboratories and domestic science rooms built with Colonial Development and Welfare funds. Increasing attention is also being paid to the teaching of Malay to native pupils and Kuo-yu to Chinese pupils. The complete course leads to higher education but this must be taken overseas; a number of scholarships are available, provided by the Governments of Sarawak, the United Kingdom, Australia and New Zealand, and by other organizations.

Chinese-medium schools. The Chinese Common Primary Leaving examination is sometimes used as an entrance test, not so much to exclude candidates as to indicate their level of attainment. Pupils take a common examination at the end of the junior middle course, i.e., after three years of secondary schooling, and at the end of the senior middle course after a further three years. The curriculum is academic, with English as a subject, but owing to the low standard of English teaching, opportunities for further education are restricted. Some secondary graduates continue their studies in institutions on the Chinese mainland, or in Taiwan, Hong Kong, or Singapore. The Government of Australia offers scholarships for courses in Australia and pupils are prepared for these by intensive instruction in English.

Teaching staff. It is difficult to obtain a sufficient number of teachers for senior secondary forms. Some of the new government schools have staff members supplied by the Australian, Canadian and New Zealand Governments under the Colombo Plan. A number of Chinese graduate teachers have been recruited from Hong Kong.

Since the introduction of the new Grant Code in 1956 teachers in aided schools have received salaries in accordance with government scales. They also have a provident fund and important medical privileges. They cannot be appointed, transferred or dismissed without the approval of the Director of Education.

Vocational and technical schools

A nautical school is to be opened to train engine and deck crews for the coastal shipping on which Sarawak's communications greatly depend.

An artisan training scheme is in preparation consisting of a trades training course of two to three years in a special school, followed by two to three years' controlled apprenticeship.

In view of the limited present needs for higher grade technicians the use of training facilities outside Sarawak seems to be the most suitable solution.

A commercial class, training students who have completed English-medium secondary education, was opened in Kuching in 1959.

Teacher training schools

Teachers in Sarawak are classified by grades: Grade I is for teachers with a university degree, Grade II for those with at least junior secondary qualifications, and Grade III for those below junior secondary. Teacher training courses at present available in the Colony prepare for certificates at Grade II and Grade III levels.

English-medium training. At the Batu Lintang centre the minimum standard for admission to the Grade III course is Primary 6, though most entrants have now had one or more years of secondary education. The course lasts 2 years and train teachers for vernacular primary schools. For entry to the Grade II course, which trains students for teaching in higher primary or junior secondary classes, the Sarawak Junior Secondary Certificate (9 years of formal schooling) is still accepted although most candidates now have the Cambridge Oversea School Certificate (11 years of schooling). Both courses include the study of English and some academic subjects, as well as a practical introduction to teaching principles and methods and of school organization. Emphasis is also laid on the need to maintain and

develop traditional skills and other aspects of indigenous cultures. The centre also trains teachers of English for Chinese schools.

Chinese-medium training. The Sibu centre offers a 2-year course in which students are trained as teachers for Chinese primary and junior middle schools, and as teachers of Chinese in English schools. All entrants have completed the full six years of middle school.

Out-of-class activities

In most secondary schools there are pupil organizations for extra-curricular activities and variations of the prefect system. These provide training in leadership, responsibility and co-operation. There is growing interest in organized games, particularly football, basket-ball and badminton, and in athletic sports. In a few boarding schools under mission or government management magazines are regularly produced, and there are groups such as photographic clubs, debating societies, chess clubs, etc.

TRENDS AND PROBLEMS

One of the basic problems is that of planning. In the present period of rapid expansion of the whole educational system the growth of secondary enrolments needs to be controlled to ensure that increased expenditure on this section does not encroach upon the funds necessary for the spread of primary education.

At present secondary schools contain a large number of over-age pupils who are not able to benefit from the academic type of curriculum and who are allowed to stay on and repeat classes several times. The introduction in 1957 of the secondary entrance examination and the division of pupils into examination and non-examination groups was intended as a first step towards meeting this difficulty. The next step will be the organization of 'streams' according to aptitude and ability.

Another major task is to bring together the different school systems into one national system. This is an essential step towards achieving the Education Department's aim of developing among all the peoples 'a sense of common citizenship, brotherhood and loyalty, . . . and of orientating the interests and attachments of pupils of immigrant races towards Sarawak, the country of their birth and upbringing'. The Department's policy is not to eliminate diversity or experimentation but to see that all schools have a sense of common aims and a greater degree of uniformity in the curriculum. The Grant Code has provided the financial and administrative framework for a national system of schools and steps are now being taken towards integration of the English and Chinese curricula and the provision of common syllabuses and textbooks.

STATISTICS

Population (mid-year 1958 estimate): 655,000.
Area: 47,500 square miles; 123,025 square kilometres.
Population density: 14 per square mile; 5 per square kilometre.

Summary of school statistics, 1953–57. In 1957 the total number of children in school was over 79,500, representing about 12 per cent of the total population. Of this total nearly 90 per cent were in 676 primary schools with the remaining 10 per cent in 36 general secondary schools and 2 teacher training centres. There were in addition 107 students from Sarawak studying at universities and educational institutions abroad. The proportion of girls enrolled was 42 per cent in Chinese schools and 29 per cent in vernacular and English schools. There was an increase in total primary school enrolment of 60 per cent between 1953 and 1957 and enrolment of girls increased by about 76 per cent over the same period. In 1957 the number of primary school teachers was over 2,250, of whom 30 per cent were women, and the pupil-teacher ratio in primary schools was 32. Total enrolment in general secondary schools increased by 75 per cent between 1953 and 1957 and enrolment of girls by over 105 per cent. Over 60 per cent of secondary enrolment was in Chinese schools. The pupil-teacher ratio in general secondary and teacher training centres was 26 in 1957 compared with 23 in 1954. (See Table 1.)

Educational finance, 1957. Total expenditure on education in the fiscal year beginning January 1957 amounted to 12,388,000 Malayan dollars, or about $19 per inhabitant. Of the total spent, about 73 per cent came from central colonial revenue, 0.2 per cent from United Kingdom funds, 4 per cent from local authorities and the remainder from voluntary agencies. Capital expenditure amounted to $1,887,000 or 15 per cent of the total. (See Table 2.)

SINGAPORE

THE EDUCATIONAL SYSTEM

There is now only one ordinance relating solely to schools, the Education Ordinance, 1957. This establishes an Education Finance Board and an Educational Advisory Council, both being consultative bodies only. The regulations issued under the ordinance specify requirements regarding school buildings and premises, classroom accommodation and equipment, cleanliness and health, discipline, time tables and curricula and emergency drill. They further regulate the use of school premises, school fees and accounts, and collections and subscriptions, besides empowering the prohibition of undesirable textbooks.

The main languages of Singapore are English, several dialects of Chinese, Malay and Tamil. The vast majority of schools use English, Kuo-yu (Mandarin), Malay or Tamil as their teaching medium, although at present only the first two languages are being used at secondary level. There are several main cultures represented by these linguistic groups and several great religions, but these are not factors which obstruct the provision of education. In English schools (so-called from the medium of instruction) are pupils of all ethnic, linguistic, cultural and religious groups.

The Ministry of Education runs schools in each of the four linguistic groups. These serve as a guide to the aided schools which absorb rather more pupils than the government schools. The former may be run by Christian or other missions, guilds or groups of philanthropic persons. Aid is granted to all schools which are non-profit-making and conform to the standards laid down in the ordinance.

The general policy of the Government is for primary education to be free whether in a government or an aided school, and for the parent to have the choice of language (out of the four official languages) in which his child is to be instructed.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education in Singapore really dates from 1891 when a standard 7 was added to the existing system of primary 1 and 2, and standards 1 to 6. The system expanded up to standard 9 and became geared to the Junior Cambridge and Senior Cambridge examinations organized by the Cambridge Examination Syndicate which were taken in standard 8 and standard 9 respectively. The examination syllabuses have been progressively modified to suit the particular needs of Malaya and the standards have evolved to the present organization of classes, namely, primary school —primary 1 to 6; secondary school—forms 2 to 5. Since the second world war a further 2-year course has been added for university preparation; these standards are known as lower form 6 and upper form 6. In 1939 the Junior Cambridge examination was dropped and now the Cambridge Higher Certificate is taken at the end of the form 6 course. Before 1941 there were only two government English secondary schools for boys and one for girls. There

were several English secondary schools run by missions and a few Chinese middle schools (secondary schools) run by groups of philanthropic persons. Since the war the number of secondary schools has multiplied, but only in the English and the Chinese medium. A Malay secondary school is expected to be established in 1961.

The original secondary schools were of an academic type and it is only since the second world war that two secondary technical schools and one secondary commercial school have been established.

Administration

Educational policy is laid down by the Minister, directed by the Council of Ministers. Overall planning is in the hands of a Permanent Secretary assisted by a Director of Education. There are two deputies, one for administration and one for professional matters. The administrative section decides from the statistics of population in various parts of Singapore where schools are to be built, taking into account the future envisaged in the master plan. The professional section looks after the curriculum and syllabuses.

Control passes direct from the Ministry to the principal of the school in the case of government schools. Both the Deputy Secretary/Administration and the Deputy Director/Professional deal directly with principals on matters affecting their sections. The Principal Staff Officer, although working under the Deputy Secretary/Administration also deals directly on matters of staffing. In most matters these three officers also deal directly with principals of schools managed by boards of governors, but if a matter of policy is concerned, the approach is generally through the chairman of the Board of Governors.

No other public authorities administer schools.

Relations are very good between the aided schools and the Ministry and there are no very marked differences between the type of education obtained in an aided school and that in a government school. Both types of school mix freely in extra-curricular activities of all kinds.

Private schools, not in receipt of grant-in-aid, are controlled to a certain extent. Their staffs must have certain qualifications and the schools are liable to inspection by the Ministry. They also have to conform to the regulations laid down in the ordinance.

Supervision and inspection. There are specialist inspectors in the major secondary school subjects—science, mathematics, history and geography, domestic science, art—who assist the Chief Inspector of Schools in the inspection of secondary schools. Specialist inspectors are graduates.

Some secondary schools have parent-teacher associations which meet periodically to discuss mutual problems but cannot do more than advise.

Finance. Sources of revenue are school fees and the Education Rate (raised from 2 per cent to 4 per cent in 1959).

The estimated figure for education revenue in 1959 is $4,409,000 and for education expenditure is $63,539,180. The difference is met from Singapore state revenue.

Government school buildings are put up by the Public Works Department and the equipment is bought from the Ministry of Education vote. The Government contributes a capital grant of 50 per cent of the total cost to aided schools in respect of new school buildings and extensions and equipment for the same.

Assistance may be given to parents in the form of scholarships to deserving children and free textbooks or remission of fees in cases of hardship.

Buildings and equipment. The standard secondary school building consists of 17 classrooms, 22 feet by 30 feet; three classrooms, 30 feet by 30 feet for history, geography and art; plus a teachers' common room, teachers' work room, book store, prefects' room, medical room, principal's office and six storerooms. The combined assembly hall, stage and library has an overall floor space of 75 feet by 112 feet. The science block has three laboratories 36 feet by 40 feet, and three storerooms. Girls' schools also have a domestic science block. A tiffin shed or tuck-shop is also provided in all schools.

School welfare services. Medical and dental inspections of children are carried out approximately once a year and children showing symptoms of illness may be sent to school clinics by principals of schools at any time. Poor children may be supplied with free spectacles and, as noted elsewhere, these children can have free places and free books.

School principals try to give guidance to pupils on the choice of a career and in some schools there are parent-teacher associations to encourage co-operation between school and home for the child's welfare.

TYPES OF SECONDARY EDUCATION

Secondary education is available in the following types of schools: secondary grammar schools (English- and Chinese-medium)—these form the bulk of the secondary schools at present; secondary technical schools (English-medium); secondary commercial schools (English-medium); junior trade schools (English-medium); vocational schools (English- and Chinese-medium); special evening classes (English-medium); secondary evening classes for over-age pupils (English- and Chinese-medium).

Secondary school leavers can enter: the University of Malaya, on results of Higher School Certificate; the Nanyang University, on passing entrance examination; the Singapore Polytechnic, on results of Cambridge Oversea School Certificate or Government Senior Middle examinations; or the Teacher Training College (English or Chinese section), on results of Cambridge Oversea School Certificate or Government Senior Middle examinations.

The school year runs from January to December and is divided into three terms; the actual opening and closing dates may vary for the different types of schools (English, Chinese, Malay, Tamil). Certain other holidays are given in term time for national religious festivals. Most schools have a five-day week (Monday to Friday), but a few add Saturday. Secondary school hours are normally from 7.45 a.m. to 1.15 p.m.

General secondary schools

English secondary (grammar) schools. The aim is to give

pupils a good grounding in general subjects for four years, culminating in the Cambridge Oversea School Certificate examination.

Selection is by the Secondary School Entrance examination taken by all pupils in Primary 6 of the English primary schools. Pupils are allocated in order of their performance in the entrance examination. If they cannot be allocated to the school of their preference, they are, as far as possible, sent to the school nearest their home. In some schools principals group pupils into streams by general ability, while in others they are grouped by age.

Subjects generally taught are English, English literature, mathematics, a local language, history, geography, ethics (or religion if parents wish and if feasible), science. Science is generally taught for the first two years as general science with later specialization in physics, chemistry, biology for certain streams. Not more than two science subjects can be taught up to School Certificate level, partly owing to shortages of science staff and partly to the need for a broad based education. In form 6 a greater choice of subjects is given to the pupil and he is encouraged to do more individual reading in his subjects.

Most secondary schools conduct two internal examinations every year. Owing to pressure from below, promotion is automatic as a general rule from form 2 to form 3. A certain amount of weeding-out is done at form 3 level, but pupils reaching form 4 are generally allowed to go on to take the Cambridge examination.

Teaching staff in secondary schools should be graduates. In Singapore, university graduates with a diploma in education are accepted into the Singapore Education Service and are posted to secondary schools. Those not possessing a diploma may be accepted as teachers and can take a part-time diploma course of 3 years' duration. However, not enough graduates are entering the service yet and secondary school staffs include teachers trained in the certificate courses or normal courses of the Teacher Training College who have the academic ability to teach the lower classes of secondary schools. Such teachers are in the main trained for primary work, but because of the existing shortage of secondary school teachers some of these trainees are selected after one year of training to do a course leading to secondary school teaching.

Chinese middle schools. The main purpose of these schools is to give pupils a good grounding in general subjects for six years (three years junior middle and three years senior middle), culminating in the Government Senior Middle examination, after which further avenues open up parallel to those for English school pupils.

Selection of pupils is made by the individual schools, except that the bigger government Chinese schools run a common entrance examination. Pupils are mostly streamed into classes on the basis of both age and ability. There is no streaming for individual subjects. Many pupils do not go beyond the three years of junior middle school.

Subjects generally taught are Chinese, Chinese literature, English history, geography, mathematics, science and art.

A large proportion of teachers in these schools have had no professional training and much of the teaching is in the form of lecturing. Most pupils follow the same course and there is little individual choice of subject.

School work is tested and pupils are reported on every term, i.e., three times a year. Pupils cannot be retained in a class for a second year if they thereby become over-age for that class.

Many of the staff of the middle schools are graduates of Chinese universities, but such graduates cannot normally be recruited owing to the restrictions on immigration. As a result the graduate staff is fairly thinly sprinkled over the schools and certificated and normal-trained teachers instruct many of the lower forms, as is the case in English schools. From 1960 the Nanyang University should begin to make up the shortage.

Secondary evening classes for over-age pupils (English and Chinese). These classes are run on the same lines as the respective types of school, English and Chinese, and offer the same subjects, but with less choice. The classes are held in secondary school buildings in the afternoons and the teachers are morning school teachers. These teachers are allowed to take up to six hours a week extra work in addition to their morning school duties.

Vocational and technical schools

Secondary technical schools (English-medium). The aim is to give pupils a fairly general grounding in school subjects with a bias towards the technical aspects of science and mathematics. The course lasts for 4 years full-time, culminating in the examination for the General Certificate of Education conducted by the Associated Examining Board.

Selection is by the Secondary School Entrance examination as for grammar schools and those successful pupils who opt for technical education are drafted to technical schools. The numbers opting for these schools are well distributed through the pass list and the demand exceeds the supply of places.

Subjects taught are mainly the same as in grammar schools with rather less time spent on English literature, history and geography, in order to make time for studying mechanical drawing, workshop practice, handicraft, etc. Achievement testing is carried out as in grammar schools.

Staff with the qualifications for teaching in technical schools are very few at present but steps are being taken to train handicraft teachers by sending already qualified teachers to the Singapore Polytechnic to learn handicraft, either wood or metal. In respect of subjects common to both, these schools have to compete for staff with other secondary schools. For the technical schools' own particular subjects a few teachers are abroad on Departmental scholarships. In time to come it is hoped that most technical teachers will be trained through the Polytechnic.

Junior trade schools (English-medium). The aim is to train boys in trades up to a level enabling them to enter apprenticeship schemes. The course lasts for 3 years full-time.

Selection is by an entrance test and pupils must have completed the primary school course. Generally the applicants are those who have failed the Secondary School Entrance examination. The average age of entrance is about 14.

Subjects taught are general mechanics, electrical and

general building construction in addition to further work in the basic primary school subjects.

Boys are tested in their trade and other subjects twice a year and at the conclusion of the 3-year course are awarded a trade school certificate by the school.

Teaching staff for the ordinary school subjects have the same qualification as those teaching in the lower classes of secondary schools. A few of the trades teachers are recruited from among those having City and Guilds of London Institute qualifications but many are recruited as tradesmen and have no paper qualifications.

Girls' vocational schools (*English-, Chinese- and Malay-media*). The aim is to provide girls with a career based on practical ability in vocational subjects.

Pupils are recruited at the end of form 3, i.e., after two years of secondary school work. All pupils in the English-medium school take English language, a local language, arithmetic and music. They also branch out into various channels, taking commercial subjects, child welfare courses, laundry-work or ante- and post-natal care courses. Some of these courses are to help them as future parents or as assistants in clinics, social welfare centres and kindergartens. In these schools practical ability is emphasized above academic attainment.

At the end of its 2-year courses the school issues its own certificates which, it is hoped, will in due course find official recognition.

Teachers of general subjects have the ordinary qualifications of teachers in the lower classes of secondary schools. There is a shortage of specialist teachers.

At present there is only the nucleus of Chinese and Malay vocational schools.

Secondary commercial schools (*English-medium*). These schools prepare for the examinations at various levels of the London Chamber of Commerce. They follow fairly closely the teaching programme of the general secondary schools, except that commercial subjects take the place of the sciences. Staffing follows the pattern of the general secondary schools for the general subjects, but the qualifications of the specialist staff are not as high as is desirable.

Boys' handicraft schools (*English- and Malay-media*). These are schools which give boys some practical knowledge of handicrafts (wood and/or metal). They conform to no particular pattern. The English-medium school gives part-time training at one centre to boys already in English primary schools, merely to enable them to use their hands and with no special vocational intent. It is not strictly a secondary school. The Malay-medium school gives a full-time course of two years' practical work in woodwork and metalwork to pupils.

Teacher training schools

There is one teacher training college in Singapore whose prime function is to train teachers for primary schools in the English, Chinese and Malay media. The first two media offer two courses: 2-year Certificate of Education (full-time) and 3-year Normal Certificate (part-time). Pupils are taken into these courses with a Cambridge Oversea School Certificate qualification or Government Senior Middle Certificate of specified standard.

For the Malay medium there are two courses: (a) 3-year Normal Certificate (part-time), and (b) 3-year course (part-time) at a lower level. Course (a) is training staff for new Malay secondary schools to start in 1960 and (b) trains Malay primary school teachers. The qualification to enter (a) is a Cambridge Oversea School Certificate with a credit in Malay, whereas entrance into (b) comes after primary 7 in a Malay school. It is therefore only course (b) which may be considered to be at secondary level.

The staff of the training college is drawn from the schools themselves and consists of graduates, certificated teachers and normal-trained teachers who show ability in teacher training. The majority of the staff are full-time, but for some subjects part-time staff are employed.

Other specialized schools

These include schools of music, art, dancing and ballet, and embroidery (Malay native costumes).

There are also language schools teaching Hindi, Gujerati and Arabic; these institutes are registered and sponsored by their respective communities to propagate their languages and maintain their cultures. A number of correspondence schools, most of them proprietary registered private schools, provide various kinds of cultural and vocational courses for adults.

Out-of-class activities

Every English secondary boys' or girls' school has a school prefect system under the guidance of a Prefectorial Board consisting of the Principal, the senior master in charge of discipline, and senior prefects. As a rule prefects are chosen from among the senior form pupils who are best both in conduct and academic performance. They help the school authorities in maintaining general discipline and in performing various other duties such as the running of extra-mural activities and cultural and social functions.

In most secondary schools, there are at least one or two youth organizations in existence which aim at developing the moral character and leadership qualities of their pupils: School Cadet Corps, Boys' Brigade, Boy Scouts and Cubs, Girl Guides, Red Cross, St. John's Ambulance Corps, Girls' Life Brigade, etc.

Every encouragement is given to all pupils to take part in some form of sports activity (football, cricket, tennis, athletic sports, swimming, etc.) either through inter-class or inter-house competition. Although the object is to cater for all pupils, the best performers in each sport form a combined schools side and these are either trained by the Ministry's own coaches or invited coaches, or with the help of the various governing bodies.

Inter-school and combined school fixtures are arranged by the school sports councils in co-operation with the various governing bodies. The chief aim is to strengthen the unity that has been built up amongst all the various schools in Singapore through sports. The Ministry is also anxious to foster good will and understanding with the neighbouring states and thus touring teams in the various games are encouraged, and visiting teams are welcomed.

Most English secondary and Chinese middle schools have various cultural clubs embracing literary and dramatic work, debating societies, music and gramophone clubs, school choirs, orchestras and bands, photographic societies, art and sketching clubs and geographical and historical societies.

TRENDS AND PROBLEMS

In the past, the importance of Singapore has resided in its trade and commerce. In the light of this the aim of almost every pupil has been to acquire sufficient academic qualifications to work in the great commercial firms and government agencies. The School Certificate has therefore been the goal of almost every school pupil.

With the recent development of trading facilities in the surrounding territories and with the rapid increase in population it has now become quite clear that Singapore can no longer rely on trade alone for survival. Attention has been turned towards finding other sources of employment for the younger generation. The possibilities for industrialization have constantly occupied the minds of the Government and private enterprises. Future educational policy therefore will depend very much on the future economic policy of the Government.

The future trend of secondary education is summarized in the 1953 education report as follows: 'The bulge due to the post-war increase in the birth-rate will not reach the secondary school until 1960, and the period of most rapid expansion of the secondary school might reasonably be expected to be from 1960 to 1964. But it is quite clear that the Colony cannot yet undertake to give every child a secondary education and that admission to the secondary school must be determined by some form of selection. The difficulty is that the numbers admitted to the academic secondary school depend to some extent on the needs of the community for students with the School Certificate four or five years later, as well as on the number and ability of the pupils seeking admission. The present policy of the Department is to admit to a government secondary school every child who has a reasonable hope of passing the School Certificate examination before he leaves. Later on, as more and more children leave the primary school each year, it will be possible to set a higher standard of admission to the academic secondary school, and at the same time to increase the number of technical and modern schools. But it must be emphasized that there will be few of these schools at first and they are largely experimental, and that at this stage there can be no question of a secondary school place for every child.'

In the case of Chinese middle schools, the position is not so acute. Every pupil completing the primary school course has a reasonable chance of also receiving secondary education. Those who leave school immediately or some time after completing the final primary school year do so because of family economic ties rather than lack of accommodation in schools.

However, the demand for secondary education has been steadily increasing. People are no longer satisfied with a primary education alone; there seems to be a thirst for as high an education as possible. This has naturally resulted in increased expenditure for education, amounting today to a quarter of the national budget. It is also worthy of note that the type of grammar school education which so far has been given in both English and Chinese is gradually giving way to a type of education which will prepare pupils for the economic and industrial life of the island.

Since the opening of the Polytechnic in 1958, there has been an increased demand for technical education. To prepare post-primary pupils for entry into the Singapore Polytechnic it would be desirable in the near future to streamline the education system to suit the economic needs of the island. It is therefore hoped that more and more schools teaching trade skills will be opened.

STATISTICS

Population (mid-year 1958 estimate): 1,515,000.
Area: 224 square miles; 580 square kilometres.
Population density: 6,763 per square mile; 2,612 per square kilometre.

Summary of school statistics, 1953–57. In 1957 total enrolment at all levels of education from primary schools to the University of Malaya was 264,897, representing about 18 per cent of the total population. Of the total enrolled, 84 per cent were pupils in primary schools, 14 per cent in general secondary schools and about 2 per cent in teacher training colleges and universities. The proportion of girls was 42 per cent in primary schools, 36 per cent in general secondary schools, 45 per cent in teacher training colleges and 22 per cent at universities. The teaching staff at primary and secondary levels numbered 9,371, of whom over 46 per cent were women. The average pupil-teacher ratio was 29 in primary and 25 in general secondary schools. Compared with 1953 enrolment had increased by 56 per cent in primary and by 102 per cent in general secondary schools. (See Table 2.)

Examination results in secondary education, 1953–57. In 1957/58, 2,303 candidates passed the Cambridge Oversea School Certificate compared with 925 in 1953/54. The proportion of girls increased from 27 per cent to 34 per cent over the period under review. In 1957, 54 candidates, including 9 girls, were awarded the Cambridge Higher School Certificate compared with only 2 successful candidates in 1953/54.

Educational finance, 1956. Total expenditure on education

in the fiscal year beginning January 1956 amounted to 42,216,988 Malayan dollars or about $29 per inhabitant. Of this sum, 93 per cent ($39,252,581) came from territorial revenue, 4 per cent ($1,571,377) from local authorities and the remaining 3 per cent ($1,393,030) from voluntary agencies. Capital expenditure in 1956 ($5,374,201) was about 13 per cent of the total. The distribution of recurring expenditure by level and type of education is given in Table 1.

3. Including 22 primary schools with secondary departments.
4. Including primary schools with secondary departments.
5. Including teachers in trade schools.

BAHAMAS

The Bahamas are a chain of islands stretching from the coast of Florida to Haiti. The principal island, New Providence, contains the capital, Nassau, and some 40 per cent of the total population. Government is vested in a Governor, Executive and Legislative Councils appointed by the Crown, and a House of Assembly elected by the people.

THE EDUCATIONAL SYSTEM

Education is administered under four separate Acts and the respective amendments: the Primary Education Act, 1908; the Secondary Education Act, 1926; the Secondary School Act, 1927; and the Industrial Schools Act, 1928.

Under the Primary Education Act, as amended in 1951, a Board of Education of five members, appointed by the Governor, is responsible for all public elementary education, teacher training, vocational, technical and adult continuation classes. The Director of Education is the chief executive officer of the board. He is assisted by a Chief Inspector of Schools and the usual departmental staff. The Act provides that education shall be compulsory for children between the ages of 6 and 14.

The Acts of 1926 and 1927 place secondary schools directly under the Governor-in-Council.

The Industrial Schools Act refers to the education of delinquents. There is one such school for boys, which does not come under the jurisdiction of the board.

Public funds for education are derived mainly from colonial revenue. The Government grants aid to private or denominational schools which meet certain requirements. Education is free in primary schools maintained by the board.

The full course in Board of Education primary schools is divided into three stages: two years' preparatory (classes I to IV, with promotion every half year); three years' junior (grades 1 to 3); and three years' senior (grades 4 to 6). The senior classes, which in urban areas are usually organized as separate schools, may be considered to be at lower secondary level (ages 11+ to 15 or 16) and will be referred to again in the section dealing with the various types of secondary education available in the Bahamas. Post-secondary education has been limited to teacher training and various technical courses. For higher education students attend universities and colleges abroad, usually in the United Kingdom, Canada and the United States of America; a number of scholarships are provided.

THE DEVELOPMENT OF SECONDARY EDUCATION

A government secondary school was founded in 1804 and another in 1839 but both institutions were short-lived. In the second half of the nineteenth century schools were founded by various religious organizations and still today the majority of the secondary schools are denominational, most of them having their own primary departments. The present Government High School was established in 1925.

As already mentioned, the Board of Education exercises no control or supervision over secondary schools, which come directly under the Governor-in-Council. The Government High School is managed by a committee appointed by the Governor. Under the 1926 Act 'to encourage and assist secondary education in the Colony', government grants are payable to approved schools. Annual grants are calculated on the basis of the number of pupils in attendance and the number and qualifications of the staff. There are also special grants which take the form of assistance towards the travel costs of staff recruited overseas. The Act further provides that any person authorized by the Governor shall have the right 'at all reasonable times' to inspect a secondary school which is receiving a grant.

All secondary schools are fee-paying; every year the Government awards eight scholarships tenable at the Government High School.

As regards technical and vocational education, some of the more important developments have been the provision by the Education Department, beginning in 1947, of evening classes in technical and domestic science subjects, and the opening of the Government Technical School in 1949.

TYPES OF SECONDARY EDUCATION

The Government High School recruits pupils at the age of 11+ by means of a competitive entrance examination. Private and denominational secondary schools make their own admission arrangements. The secondary course prepares for the Cambridge Oversea School Certificate and Higher School Certificate examinations, and curricula are largely determined by the requirements of these certificates.

Senior schools offer a more practical type of course with needlework and cookery for girls and technical subjects for boys. Elementary agriculture is also taught in most schools. On completing the course, pupils take a local school certificate examination.

Continuation classes for pupils who have left school are held in general, commercial and technical subjects. The last-named follow the syllabus laid down by the City and Guilds of London Institute and include courses in telecommunications engineering, electrical engineering, practical and mechanical engineering design. There are also classes in domestic subjects (housewifery, cookery, table waiting, hotel service, etc.) at the Dundas Civic Centre, a government-aided institution not under the Board of Education.

Out-of-class activities. The schools encourage participation in athletics, swimming and team games, and activities such

as the Junior Red Cross, Boy Scouts, Girl Guides, social and cultural clubs, etc.

TRENDS AND PROBLEMS

The Deputy Educational Adviser of the Colonial Office recently carried out a survey of education in the Bahamas and his report is now under consideration by the Government of the Bahamas.

Administratively, one of the main problems is the nature of the present educational legislation of the Colony, and a proposal to replace it by a single comprehensive ordinance is under consideration.

Educationally, the training and supply of teachers is perhaps the greatest problem, and expansion of teacher training is envisaged in 1960. Attention is also being given to the review of policy and planning of technical education. A special problem exists in the scattered nature of the Colony, and the difficulties of transportation; in 1959 the headquarters staff of the Education Department was increased and reorganized to make possible more effective supervision of schools.

STATISTICS

Population (mid-year 1958 estimate): 133,000.
Area: 4,400 square miles; 11,396 square kilometres.
Population density: 30 per square mile; 12 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 enrolment in all schools totalled 22,358 pupils, representing about 19 per cent of the total population. About 95 per cent of enrolment was in primary schools, 4 per cent in general secondary and vocational schools and the remainder in teacher training colleges. Girls made up over 50 per cent of enrolment at primary and secondary levels, and 66 per cent of enrolment at the teacher training college. The teaching staff numbered 475 in 1957/58 of whom nearly 60 per cent were women. The pupil-teacher ratio was 51 in primary and 18 in general secondary schools in 1957/58. Compared with 1953/54, enrolment in primary schools did not increase but the number of pupils in secondary schools rose by 29 per cent. (See Table 2.)

Educational finance, 1958. Total public expenditure on education in 1958 amounted to 450,926 pounds sterling, or approximately £3.4 per inhabitant. This total included £12,247 for capital expenditure. A breakdown of recurring expenditure by level and type of education is given in Table 1.

BERMUDA

THE EDUCATIONAL SYSTEM

Under the provisions of the Education Act, 1954, the general administration of education is the responsibility of the Board of Education, the members of which are appointed by the Governor. The board supervises the expenditure of funds placed at its disposal by the legislature. Its official adviser and chief executive officer is the Director of Education. In addition to the Director, the staff of the Education Department consists of two inspectors of schools, two supervisors, an organizer of physical education, and clerical staff.

Administratively, schools are classified as 'vested', 'non-vested', and private. In the vested schools, the management is vested in local committees or governing bodies, to whom the Board of Education makes annual grants under certain conditions. The non-vested schools are administered directly by the Board of Education and there is no committee between the school and the board. Private schools receive no government aid.

The educational ladder comprises pre-primary, primary and secondary schooling, the latter including academic, practical, technical and vocational courses. There are no facilities for higher education or teacher training, but a considerable number of scholarships, public and private, are available for study abroad. Education is compulsory from age 7 to under 13, and children over 5 and under 16 have the right to free primary schooling. All schools except four are co-educational. English is the medium of instruction in all schools.

THE DEVELOPMENT OF SECONDARY EDUCATION

During the eighteenth and the first half of the nineteenth century there were several attempts to provide post-elementary education. Some, like Bishop Berkeley's project to found a college for the sons of North American settlers and Indians, had to be abandoned, while others resulted in the opening of short-lived institutions such as Devonshire College (1829–35) and a college for Coloured people (1853–56). However, by the present century the various parishes had developed schools (now vested schools) most of which catered for children of all ages and thus provided both primary and secondary classes. To meet the increasing demand for secondary places, the board has opened additional secondary schools or secondary departments of schools. Moreover, whereas the secondary

curriculum of the older vested schools tends to follow as closely as possible the model of the English grammar schools, the board has sought to cater for the non-academic pupil by providing 'secondary practical schools'. An important landmark in the broadening of educational provisions was the opening of the Bermuda Technical Institute in 1955. In 1958 a vocational school for girls (needlework trades) became a secondary practical school.

Fees are charged in secondary schools (and some of the primary schools), the rates varying according to the type of school and in some instances according to the position of the pupil in the school. The highest fee payable, i.e., in the top form of one of the general secondary schools, is about £60 per annum, exclusive of the cost of books and stationery. The fees at the secondary practical schools are £5 a term, and at the Technical Institute £9 a term. Twelve scholarships tenable at local secondary schools are awarded annually by the Board of Education. The period of tenure is for four years but may be extended to five years on the recommendation of the principal of the school. The scholarships include the cost of fees and textbooks. There are also a number of scholarships provided by private individuals, by parent-teacher associations, and from endowments.

TYPES OF SECONDARY EDUCATION

The basic primary course lasts 6 years but as many children begin school before they reach the compulsory attendance age of 7, the age at which pupils transfer from the primary to the secondary stage varies. Pupils awarded Board of Education scholarships tenable at the secondary schools are between the ages of 11 years 4 months and 12 years 4 months. These scholarships are awarded on the results of a written examination in English and arithmetic, an intelligence test and an interview. In the schools which have both primary and secondary departments, promotion to the secondary departments is based upon internal examinations. The admission of pupils to other schools providing secondary education is, in most cases, by means of attainment and intelligence tests. In certain instances there are special aptitude tests.

There are seven schools under the administration of the Board of Education and two others that provide secondary education up to Cambridge Oversea School Certificate standard, and at four of these schools pupils are prepared for the Cambridge Higher School Certificate examination. The curriculum followed is mainly designed to meet the requirements of these examinations. Commercial courses are provided at seven of these schools.

The new secondary practical schools provide a 3-year course, with 2 further years for those who desire to take certain subjects of the London General Certificate of Education, Royal Society of Arts, or City and Guilds examinations. Pupils are normally transferred from the primary schools at the age of 13, although younger pupils who have reached a certain standard are also eligible for admission.

At the Technical Institute one stream pursues a technical course while the other and more numerous group follows the trades course. The institute also has a programme of evening extension classes which include both the teaching of workshop practices and the preparation of adults for the GCE examinations. The staff of the institute is drawn partly from the United Kingdom and partly from local sources.

In all secondary schools the traditional English games form a well-established part of the curriculum.

TRENDS AND PROBLEMS

The board's policy of providing secondary education for all has advanced to the point where only the western parishes are in need of further facilities, and it is anticipated that by 1961 it will be possible to accommodate all those over 13 who wish to attend.

The very provision of secondary schooling for pupils differing widely in their abilities and aptitudes has, however, brought attendant problems. Instruction with a practical bias has been offered as the best complement to the established 'academic' curriculum, bearing in mind the particular needs of the Colony. As the great majority of pupils in secondary schools will not be going on to institutions of higher education but will be seeking employment commensurate with their abilities, the problem of how to provide a wide differentiation of courses will become more and more urgent.

[*Text revised by the Director of Education, Hamilton, in January 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 43,000.
Area: 20 square miles; 53 square kilometres.
Population density: 2,150 per square mile; 811 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957 there were 9,578 pupils enrolled representing nearly 23 per cent of the total population. Primary schools accounted for 83 per cent of total enrolment, general secondary schools 13 per cent, and vocational schools 4 per cent. Girls were enrolled in about the same proportion as boys in primary and general secondary schools but outnumbered boys considerably in vocational schools. Women teachers represented 87 per cent of the total teaching staff in primary schools and 50 per cent of staff in general secondary schools. The average pupil-teacher ratio in primary schools was 24 and in general secondary schools 14. Enrolment of boys and girls in general second-

ary schools increased by about 50 per cent between 1953 and 1957. (See Table 2.)

Educational finance, 1957. Total public expenditure on education in the fiscal year beginning January 1957 amounted to 474,832 pounds sterling, or about £11 per inhabitant. All this money was derived from territorial revenue. Capital expenditure (£32,009) was about 7 per cent of the total. The distribution of recurring expenditure by level and type of education is given in Table 1.

BRITISH GUIANA

THE EDUCATIONAL SYSTEM

The Director of Education is responsible for the administration and supervision of education and for the training and certification of teachers. He is assisted by some 17 senior officers of the Department, and is advised by the Education Committee, a statutory body reconstituted in February 1957 with 15 members.

The Minister of Community Development and Education exercises responsibility for matters affecting education. The Director of Education continues to perform the duties of Permanent Secretary of the Ministry of Education, which is merged with the Education Department.

Primary schools in the Colony are divided into three groups: government schools, government-aided, and unaided private schools. Most of the government-aided schools are owned by the various religious denominations, to which the Government makes annual grants for the provision of equipment, maintenance of buildings and the payment of teachers' salaries. There are also non-denominational schools which qualify for similar grants; they are usually located on sugar estates and mining settlements. Government schools are entirely under the control of the Education Department and are managed by the education officers of the districts in which the schools are located or by district commissioners and other senior government officers. All government and government-aided schools are supervised by the education officers of the Education Department, who visit the schools from time to time. Non-aided private schools are run by private individuals or organizations and do not come under the supervision of the Government. The Government provides free education for children between the ages of 5 to 16 years. The compulsory age range is from 6 to 14 years.

Secondary education is now provided in two government-owned secondary schools, nine government-aided secondary schools, and in approximately twenty privately run secondary schools known to the Education Department.

The Carnegie School of Home Economics and the Government Technical Institute provide vocational training at the post-primary level for students and teachers in training.

Since the opening of the University College of the West Indies in 1948, the Colony has made an annual financial contribution towards it, and students from the Colony are eligible for the annual award of scholarships and exhibitions at the college.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education was first provided by grammar schools started as private secondary schools, usually under the auspices of religious denominations. Only after 1900 was any progress made in the attempts to relate education to training for life. In the period under review there have been, however, significant developments in practical education and in the intensification of efforts to offer special courses in handicrafts, home economics and agriculture in schools.

The two government secondary schools, Queen's College for boys and Bishops' High School for girls, were founded

as private secondary grammar schools. The former was established in 1844, and in 1876 the Government assumed full responsibility for it. Bishops' High School was founded as a diocesan (Anglican) secondary grammar school for girls in the early 1870s. Other private secondary schools established before 1900 included three Roman Catholic schools. All these schools were in the capital city, Georgetown.

After 1900 secondary schools were established by the Canadian Mission Council in areas outside Georgetown. The Berbice high schools for boys and girls were started in 1916 in the town of New Amsterdam, and Corentyne High School, a co-educational school, was opened in 1938 on the Corentyne Coast.

The Government first granted aid in the form of a block grant to the Berbice high schools in 1920 (boys) and 1923 (girls). St. Stanislaus College (Roman Catholic) was first granted a government subsidy in 1952. A new scheme of government aid as outlined in the Memorandum on Secondary Education was approved by the Government in 1957. Fifteen private secondary schools, including the two aided schools, applied to be considered for government aid to be granted in accordance with the Secondary Schools Regulations, 1957. It was suggested in the memorandum, and accepted by the Government, that the two government secondary schools, Queen's College and Bishops' High School, should be fully integrated with the national educational system and come within the general control and supervision of the Ministry and Department of Education.

As from January 1958 the Government has provided grants to nine private secondary schools including two schools that were hitherto in receipt of block grants. This aid has taken the form of salaries grants and practical subject grants for science, woodwork and home economics. Thus 3,700 additional pupils immediately enjoyed a grammar school education under a grant-aided system which had hitherto been limited to about 1,100 pupils. Significant developments in these aided schools include a reduction in the size of classes, improvement in the quality of staff recruited, the establishment of new laboratories and the provision of additional equipment for existing laboratories and thereby the expansion of facilities for the teaching of science to more secondary school pupils. Non-recurrent special grants have been made to seven schools to help defray the costs of provision of new classrooms, science laboratories, libraries and home economics rooms. The preparatory forms at the two government secondary schools were discontinued as from July 1958. This made possible the admission of an additional stream of boys and girls of the 11+ age group.

The Carnegie Trade School for Women, now the Carnegie School of Home Economics, was opened in 1933, and the Government Technical Institute in 1951.

Legal basis

The principal laws and regulations governing secondary education (general and vocational) are:

Secondary Schools Regulations No. 18 of 1957 made under the Education Ordinance (chapter 91), setting out the conditions of government aid.

Government Technical Institute Regulations No. 26 of 1955, vesting the management in a board of governors and fixing the minimum age for admission to evening classes at 14.

Carnegie Trade School for Women Regulations, 1939.

Industrial Training (Apprenticeship) Regulations No. 7 of 1955 made under the Industrial Training Ordinance, which state that the minimum age at which a young person may enter into an (apprenticeship) agreement shall be 15 years and that no person shall be registered by the Board of Industrial Training as an artisan until he has reached the age of 20 years.

Administration

The two government secondary schools are managed by boards of governors appointed by the Governor to advise the Ministry and Department of Education on all matters of general policy and finance relating to these schools. The boards of governors of the nine aided secondary schools are executive bodies in whom are vested control and management of these schools; they submit any statistical returns and estimates that may be required by the Director of Education, including annual estimates of income and expenditure and audited statements of income and expenditure for each school year.

The government-owned vocational schools are similarly administered and controlled by advisory boards, and government approval of estimates is necessary.

The curricula (with time analyses) of every government and aided secondary school are submitted to the Director of Education for approval. Subject to this approval the principals are free to organize their curricula and use such textbooks and methods of instruction as they think fit. There are no textbooks or curricula prescribed by the Government for use in secondary schools.

Periodical inspections are carried out by the Director of Education, the Assistant Director of Education (Post-Primary) and other education officers with training and experience as graduate teachers in secondary schools or teacher training colleges.

Finance. The government secondary schools are financed directly from government revenue. Their annual estimates of expenditure have to be approved by the Legislature. The principals are subject to the same financial regulations as senior officers in other government departments, and the accounts of the schools are audited by government officers. Fees paid by pupils are lodged in the Treasury as revenue accruing to the Government. This form of financing also holds good for the government vocational schools.

The boards of governors of aided secondary schools receive salaries grants and practical subjects grants from the Government. The salaries grants, which are paid monthly, do not cover total salaries, but represent the differences between a fixed contribution by the boards to the salaries of graduate and non-graduate teachers and the salaries to which the teachers are entitled by academic qualifications and teaching service according to a basic minimum salary scale. Practical subjects grants are paid quarterly by the Government for maintenance and

equipment and for expendable supplies in science laboratories, home economics and woodwork rooms. Non-recurrent special grants may be provided to help the boards of aided schools improve premises, buildings or sanitation or to provide special workrooms, laboratories or libraries.

Fees are charged at all aided secondary schools and are used to help provide the schools' contributions to salaries of staff and other items of school expenditure.

A number of government scholarships are provided annually for children between the ages of 10 and 13 years on the basis of a competitive examination. These scholarships provide for free tuition for five years at an approved secondary school, government or aided, and an allowance to assist in the purchase of books and in the maintenance of the scholar. The cost of tuition and of maintenance allowances is borne by the Government.

TYPES OF SECONDARY EDUCATION

Secondary education is mainly of the grammar school type. Pupils from some secondary schools attend classes at the Government Technical Institute with a view to offering technical subjects, together with their general educational subjects in the General Certificate of Education examination at Ordinary level.

The vocational type of secondary education is supplied by the Government Technical Institute and the Carnegie School of Home Economics in Georgetown, at the Bookers Training Centre at Port Mourant and the Demerara Bauxite Company Trade School at Mackenzie.

Pre-vocational or pre-apprenticeship courses have been recently introduced in the woodwork centres and departments where boys of the 13+ age group who are still attending primary schools are given instruction over a 2-year period in technical subjects of the preliminary craft course syllabus devised by the Technical Institute. If successful, these boys may, on leaving school, enrol in apprenticeship courses in crafts of their choice.

No organized help or direction is given to the pupil or parents in choosing the type of secondary education. Individual head teachers of primary schools may of their own accord offer advice to parents.

The types of further education open locally to secondary school pupils include courses in commercial education at schools run by private individuals, training as teachers at the Government Training College for Teachers, as nurses, dispensers, sanitary inspectors, chemists and druggists at government hospitals and the Medical Department, training as agricultural instructors at the Agriculture Department, and in various craft and technician courses at the Government Technical Institute and two trade schools run by Bookers Estates and the Demerara Bauxite Company. Training as land surveyors is provided by the Lands and Mines and Public Works Departments and as mates and pilots for coastal and intercolonial steamships by the Transport and Harbours Department and Government Technical Institute.

The secondary school year comprises 36 weeks or three terms of an average duration of 12 weeks. The school week is five days and the school day normally consists of seven periods of 40 minutes each. The school year normally runs from September to July. There are schools from which pupils are entered for the Cambridge Oversea examinations which are held in December. The principals of these schools tend to admit new pupils in September of one year and again in January of the succeeding year.

General secondary schools

These schools, which are mainly of the grammar school type, aim at providing a general education over a 5-year course leading to the Oversea examinations of the London or Oxford and Cambridge General Certificate of Education Ordinary level or the School Certificate of the Cambridge Examination Syndicate. The more able pupils remain at school for another two years to follow a higher course of training usually in three subjects to the Advanced level of the London General Certificate.

Pupils are usually selected on the basis of entrance examinations set by the principals of the schools to which they are seeking admission. These examinations usually consist of attainment tests in English and arithmetic. Winners of government county scholarships are normally exempt from these entrance tests.

On admission to these schools pupils are normally grouped in classes or streams according to the levels of attainment reached by them in the entrance examinations. In the course of the first year or two there may be transfers between streams as pupils prove themselves to possess greater or less ability than was measurable by the attainment entrance tests.

At Queen's College, the larger of the two government secondary schools, pupils are taught in 'sets' according to their ability in languages and mathematics. In their third year at this school the pupils are streamed according to their aptitudes into classical, general and modern streams. The more able pupils from the classical and modern streams usually form the nucleus of arts and science sixth forms respectively, where they pursue a 2-year course of study to the Advanced level of the General Certificate of Education.

Subjects taught at these general secondary schools include religious knowledge, English, history, geography, Latin, French, Spanish, mathematics, chemistry, physics, biology, art, music, home economics, woodwork and commercial subjects. Science has until recently been taught only at the two government secondary schools and at three aided schools. Non-recurrent special grants have been made to aided schools to help meet the cost providing laboratories.

In most schools there are at least two end of term tests in the school year, with the test at the end of the third term serving as the basis of promotion from one class to the other. Teachers are free to arrange for any periodic testing in their subjects. End of term reports on pupils' work and conduct are sent home to parents by principals of all schools. Fortnightly, three-weekly or monthly reports may also be forwarded to parents.

The teaching staffs at the two government secondary cshools are good in number and quality. The majority of members of staff are graduates of universities in the United Kingdom with good honours or general degrees. It is now becoming the practice to acquire a diploma or post-graduate certificate in education. With the increase in the

number of locally qualified graduates as a result of the award of conditional scholarships to universities in the United Kingdom and of scholarships and exhibitions to the University College of the West Indies, a smaller number of graduate teachers is being recruited from overseas. The aided secondary schools were not so fortunate with the number or quality of their staffs. There has, however, been an increase in the number of graduates and better undergraduate teachers in these schools as a result of the grants-in-aid made to them in 1958. There is no provision locally for the training of teachers for secondary schools.

Vocational and technical schools

The Government Technical Institute was founded to provide technical, scientific and commercial education for students in various local industries and government departments. At present the bulk of the courses are run on a part-time day release or evening basis, but an increasing number are being arranged on the block release principle, that is, periods of full-time study alternating with periods in industry; this not only increases the training time but enable students in remote areas to attend courses. In addition to regular courses, special short courses are arranged from time to time.

The emphasis is now placed on the training of craftsmen with particular reference to apprenticeship, but recently a scheme of co-operation with the secondary schools has been introduced and the foundations for future developments for technicians and technologists are being soundly laid.

The concept of apprenticeship, in the true sense of the term, is new in British Guiana. Under legislation introduced a few years ago, however, a Board of Industrial Training was set up, and an organized scheme of apprenticeship now operates under regulations prescribed by this board. Many boys in the Georgetown area have been indentured in the engineering and building trades. Under the terms of indenture they are released by their employers on one day per week to attend classes at the Technical Institute throughout the whole five years of the apprenticeship.

The scope of the work of the Technical Institute may now be briefly described as follows:

Preliminary courses. As elsewhere in the British Caribbean territories, it has been found that many students embarking upon technical courses are handicapped by lack of general education. The Technical Institute has therefore provided pre-vocational or pre-apprenticeship courses of one year's duration. For these courses, which may be part-time, day or evening, the minimum age of admission is 15; the curriculum includes English, mathematics, drawing and elementary science. They are also offered at four extra-mural centres in the Colony and at approved woodwork centres and departments in primary schools.

Trade apprenticeship courses. Before admission to these courses students are required to have successfully completed the appropriate preliminary course or to give other evidence of a satisfactory standard of general education. The trades for which courses are at present being provided are carpenter, mason, fitter, machinist, welder, motor mechanic and electrician. The courses, which occupy one day per week, are designed to lead to Intermediate examinations of the City and Guilds of London Institute.

Evening craft courses. These provide a wide range of craft and technical subjects for students who are not able to obtain day release and include a number of trades for which day courses are not at present being provided, for example, plumbing and radio-servicing.

A healthy outcome of the growth of the apprenticeship scheme has been a demand for short intensive refresher courses for established workers who are anxious to improve or revive their skills. It is encouraging to see that these are being pursued with considerable enthusiasm. They should have the effect of inducing in the older workers an interest in the training of the apprentices and an appreciation of the work of the Institute.

Secondary technical courses. A recent development is a scheme of co-operation with seven secondary schools whereby boys who opt to take technical subjects together with their general educational subjects in the General Certificate of Education examination at Ordinary level attend the Technical Institute on one day per week. The subjects of study at the institute are geometrical drawing, a craft subject (woodwork or metalwork) and science (if not taken at school).

Teacher training. An effort is being made to extend the teaching of practical subjects in the primary schools, and various emergency schemes for the training of teachers have been instituted. At the Georgetown Handicraft Centre in 1957/58 and 1958/59 two batches of 20 teachers each have pursued a one-year course of training in woodwork together with a little metalwork and technical drawing. These teachers attend the Technical Institute on one day per week where members of the staff conduct a course on the teaching of technical subjects. On completion of their courses many of these teachers will start preliminary craft courses in their schools and thus relieve the Government Technical Institute of much pre-vocational training.

Miscellaneous courses. Courses are being offered in a considerable range of subjects other than those mentioned above. It is also the policy of the institute to offer each year, in addition to the regular courses, a programme of special short courses of evening lectures. The programme for 1958/59 comprised courses under the following titles: staircase construction, wood machining, painting and decorating, building today, owner drivers, tractor maintenance.

The Bookers Training Centre and the Demerara Bauxite Company provide sandwich courses over a full-time three-year period for study leading to the standard of the Intermediate examinations of the City and Guilds of London Institute.

Internal examinations to test attainment of students and for purposes of promotion from one stage of a course to another stage are conducted by members of staff.

The Carnegie School of Home Economics provides a general home economics training for girls of the 14 to 18 age group with a view to raising the standard of living. During the course a girl can learn enough to help her earn a living by dressmaking, cooking and possibly catering. The course also provides an excellent foundation for further training to become nurses. Students are selected by test and interview from applicants who are mostly primary school girls.

TRENDS AND PROBLEMS

The problems of secondary education or what may be more correctly termed post-primary education in British Guiana at present are to provide a liberal and more meaningful education for those pupils of the post-primary age group (11+) in the all-age primary schools, to broaden the curricula of existing secondary grammar schools, and to establish in rural areas bilateral secondary schools which will provide, in addition to the usual grammar school curriculum, courses of a pre-vocational bias in agricultural and technical subjects.

The provision of a broader education for pupils over the age of 11, unable for financial or other reasons to gain admission to existing secondary schools, may involve the inclusion in the curricula of more primary schools of preliminary craft courses as a form of pre-vocational training; these courses would lead to apprenticeship training. In a community that is essentially agricultural, agricultural courses would be another useful type of pre-vocational training for the post-primary age group in primary schools. Action is already being taken to increase the number of departments in primary schools or centres which cater for pupils from primary schools for practical work in woodwork, metalwork and home economics.

Attempts are at present being made in existing secondary grammar schools to cater for those pupils who may not be able to cope with or to derive the greatest benefit from a curriculum which was originally designed as a preparation for entry to the university. Boys from these schools are attending courses in technical subjects at the Government Technical Institute and it is hoped that on leaving school they may continue training as technicians. Some of these students may be expected to continue their studies to the technological level. One result of the proposed establishment of a Faculty of Agriculture of the University College of the West Indies in Trinidad may be the entry to this faculty of a greater number of students from secondary schools in British Guiana.

Pre-vocational training for careers in agricultural or technical fields will involve the provision of facilities for teaching science in more secondary schools. The recent grants-in-aid by the Government to secondary schools include recurrent maintenance grants for practical subjects such as science, woodwork and home economics. The provision of non-recurrent special grants for providing the laboratories and workrooms in which these subjects may be taught may also be regarded as a step in the right direction.

Further consideration may be given to the introduction of commercial courses in secondary grammar or bilateral secondary schools. These courses should then form part of a varied educational programme designed to help pupils 'to realize and develop their potentiality as persons and citizens'.

STATISTICS

Population (mid-year 1958 estimate): 532,000.
Area: 83,000 square miles; 214,970 square kilometres.
Population density: 6.4 per square mile; 2.5 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 total enrolment at all levels of education was over 118,000 pupils, representing about 22 per cent of the estimated population. This figure excludes unaided secondary schools. Of total school enrolment, 94 per cent was in primary, nearly 4 per cent in general secondary and 2 per cent in vocational schools. There were in addition 58 students, of whom half were women, training to be teachers. The proportion of girls was 49 per cent at the primary level but only 28 per cent in general secondary schools. The number of primary school teachers was over 2,750 in 1957/58 and the pupil-teacher ratio 40, as compared with 42 in 1953/54. In general secondary schools the teaching staff numbered 157, of whom one third were women, and the pupil-teacher ratio was 29.

Between 1953/54 and 1957/58 enrolment in primary schools increased by 26 per cent, in general secondary schools by 176 per cent and in vocational schools by 98 per cent. (See table.)

Examination results in secondary education, 1957/58. In 1957/58 there were 1,229 candidates for the General Certificate of Education at Ordinary level and 370 candidates at Advanced level. In addition 238 candidates passed the Cambridge Oversea School Certificate. Successful candidates for professional and technical certificates numbered 17 in the Royal Society of Arts examinations, 28 in the City and Guilds and 24 in the London Chamber of Commerce.

Educational finance, 1957. Expenditure on education in 1957 amounted to approximately 7,278,000 British West Indian dollars. (Official exchange rate: 1 B.W.I. dollar = 0.583 U.S. dollar.)

1. Including data on nursery schools.
2. In 1957/58 there were 20 unaided secondary schools with approximately 3,000 pupils.
3. Teachers in vocational schools are included with those in general secondary education.

BRITISH HONDURAS

British Honduras is perhaps unique among British colonies in the Western Hemisphere in view of the diversity of races represented; yet there are no major racial difficulties. All schools are open to all members of the community. No fewer than six languages are spoken—English, Spanish, Carib, North Maya, Southern Maya, and Ketchi—English and Spanish being predominant. The medium of instruction in the schools is English. Education in British Honduras has from the beginning been closely associated with the Christian denominations.

THE EDUCATIONAL SYSTEM

The administration of education is, under the Education Ordinance of 1926 (No. 14), the responsibility of the Board of Education and the Department of Education. The board consists of the Governor, who is president, the Colonial Secretary, the Member for Social Services of the Colony's Executive Council, and not more than seven other persons, not government officials, who are nominated by the Governor and of whom one at least must be a woman and one a representative of the teachers. The managers of denominational schools are usually represented on the board. The Director of Education, who is not a member of the board, acts as its secretary and adviser.

The board has executive powers. It makes rules which form the Education Code and advises the Government on educational matters within its purview, mainly on primary education.

All government, government-aided and private primary and secondary education in the country is subject, in

varying degrees, to the control of the Director of Education who receives advice and recommendations from the board and who, in matters of policy, is associated with the member of the Executive Council appointed by the Governor to deal with educational and other social services. The Director also seeks approval for financial expenditure from the Legislature. In the district capitals the District Commissioner represents the Director of Education in educational matters.

The primary school course comprises two infant classes, or sub-standards, and six standards, and leads to the Primary School Certificate examination; the compulsory age-range is from 6 to 14, although children may enrol at 5 and a number under 5 are accepted, especially in the towns. At ages 12 to 14 selected children pass to the secondary schools or the technical college, government scholarships being awarded on the basis of a competitive examination. Opportunities for post-secondary education are provided by two training colleges with 2-year full-time courses and by government departments which offer apprenticeships. There is also a scheme of pupil teacher training. For university education, secondary leavers go abroad, mainly to other Commonwealth countries or the United States, or take courses of the extra-mural department of the University College of the West Indies.

THE DEVELOPMENT OF SECONDARY EDUCATION

An attempt to introduce secondary education into the country was first made in the year 1845, when the Honduras Free School was made a grammar school; the headmasters were clergymen of the Church of England. Mention is made in the Blue Book for 1866 of a private school conducted by a Mr. Dunbar; it is referred to as 'the only school in which Latin was taught'. The following are the secondary schools at present in existence.

Wesley College. Established in the year 1882 as the Wesleyan High School for Boys. From 1932 to 1937 was merged in St. George's College under the joint management of the Methodist and Anglican bodies, but in January 1938 resumed under the present name and under the control of the Methodist body. It is now co-educational and has also a preparatory department for infants.

St. Catherine's Academy. Established in January 1883; conducted by the Sisters of Mercy from the United States of America.

St. John's College. A day and boarding school for boys, under the direction of the Society of Jesus, which originated in a school established in Belize in 1887. The college is now housed at Landivar.

St. Hilda's College. Founded in January 1897 as the Diocesan High School for Girls.

St. Michael's College. May be regarded as a continuation of the Diocesan High School for Boys which was first established in 1921.

Pallotti High School. Was started in 1957 by the Sisters of the Pallotti Order from Germany. Offers courses in cookery, needlecraft, handwork, shorthand and typing, leading to certificates of the General Certificate of Education.

Lynam College. In 1957 the Roman Catholic Mission, recognizing the importance of agriculture to the economic future of the country, set up this institution to provide teaching in agriculture with emphasis on practical instruction. Recognized as a secondary school in 1958.

Austin High School and Muffles College. Secondary schools run by the Roman Catholic Mission in the district capitals of Stann Creek and Orange Walk respectively. Austin High School offers a full course leading to the Cambridge Oversea School Certificate, while the more advanced students at Muffles College complete their courses at St. John's College, Belize.

Belize Technical College. Proposals for the development of technical education date back to 1935, when the Easter Report recommended that the Government should set up a Central Institution for manual training and home economics. The purposes of the college are to provide: (a) for boys and girls of secondary school age, a type of education alternative to the wholly academic type offered at the existing secondary schools, and in which the emphasis is on science and pre-vocational studies, thereby laying a sound foundation for the training of craftsmen and technicians; (b) for ex-secondary school pupils, teachers and others, evening classes in science and technical subjects; (c) classes in manual training and home economics for teachers.

After the first year of operation, a revised scheme was adopted according to which no more than 30 boys should be admitted each year for a period of three years, during which an increasing amount of practical work should be done. A limited number of boys who completed the course satisfactorily would be selected for a further course of two years, leading to the School Certificate. There would be no provision for girls other than facilities for instruction in domestic science at part-time day classes and evening classes. The emphasis would be rather on the training of skilled craftsmen and on a close association between the school and industry.

Admission to the school is by competitive examination consisting of written tests in English and arithmetic, and an aptitude test and interview. The examination is open to boys between the ages of 12 and 14, without distinction of race or religion. No promising pupil who qualifies for admission has been excluded because of inability on the part of his parent or guardian to pay the full fee. Maintenance grants are also paid to deserving pupils from the out-districts on the same terms as bursaries are awarded to government scholars attending the five other secondary schools in Belize. In 1953 the University of Cambridge Local Examinations Syndicate gave formal approval for the school to enter candidates for Certificate A in the School Certificate examination.

Evening classes were begun on 14 March 1952, when 15 students were accepted for a grouped course in science and mathematics. Since then the range of subjects offered has widened with the increasing demand, and there are now courses in chemistry, physics, mathematics, home economics, woodwork and building construction, commercial subjects, plumbing, auto-engineering and electrical installation and repair.

The school has a well-equipped physics and chemistry laboratory, at present the only such laboratory in British Honduras, which has been approved by the Cambridge Local Examinations Syndicate for the holding of their

examinations in these two subjects. There are also workshops for woodwork and metalwork and an adequately equipped home economics section. From funds supplied from the British Government under Colonial Development and Welfare a new and well equipped workshop block was opened in 1959.

Administration

The more general aspects of educational administration have been described above.

Up to 1956 all the secondary schools except the Technical High School were almost wholly denominational schools organized, financed and run by the various religious denominations. In 1957 the three non-Roman Catholic secondary schools were given grants-in-aid; since April 1958 government grants to these schools have taken the form of part-payment of the salaries of the graduate members of the staff. In 1958 the Government gave a grant to one other secondary school and made loans to two more.

The secondary schools charge fees ranging between $65 and $100 per year. There is a system of government scholarships tenable at secondary schools and bursaries are paid by the Government to deserving pupils from the districts to enable them to attend schools in Belize.

As regards buildings and equipment, some of the older secondary schools in Belize had to be completely or partially rebuilt after the hurricane of 1931. In general, school buildings are overcrowded, but plans for extension of all schools will be put into effect very soon.

TYPES OF SECONDARY EDUCATION

The following types of secondary education exist: (a) academic courses leading to the Cambridge Oversea School Certificate and Higher School Certificate examinations; (b) commercial courses leading to the Royal Society of Arts and the London County Council examinations in shorthand, typing, etc.; (c) technical day and evening courses leading to the General Certificate of Education, City and Guilds, and the Royal Society of Arts examinations in science subjects, metalwork, woodwork, cookery, needlework, etc.

Except for the advice given directly or indirectly by teachers, there is little help or direction given to pupils or parents in choosing the type of secondary education they should follow.

Normally the school year begins in January and ends in December with three terms, January-April, June-August, September-December. Regular school days are Monday to Friday.

In all schools there is a 'head pupil', elected annually by the school, and a number of prefects who carry out various responsibilities. Students take part in sports and join such organizations as the Boy Scouts, Girl Guides, Red Cross, etc. Field days are held annually.

TRENDS AND PROBLEMS

Educational authorities, fully alive to the growing demand and need for secondary education, have during the past year increased the number of government scholarship awards and bursaries by approximately 40 per cent and 60 per cent respectively. Large government loans and grants to secondary school managers for building classroom extensions also show the government's and the community's awareness of the need to provide the necessary facilities for secondary education.

Hitherto the students leaving the secondary schools were not qualified for entry into higher educational institutions or for the various jobs that are open to them without further education. Efforts are, however, now being made to improve the standard of teaching at secondary schools and to extend secondary instruction to include science subjects at examination level. Better qualified staff, better remunerated, were employed during 1958.

In the field of technical education the new policy, proposed by the new Director of Education, who is also acting principal of the Belize Technical College, includes part-time day classes for young men employed by government departments and private business firms, day classes in science for secondary school pupils and evening classes in cookery, needlework, shorthand, typewriting, English, woodwork, metalwork, physics, etc. The scheme is designed to provide the technical skills needed for the economic, social and political development of the country.

STATISTICS

Population (mid-year 1958 estimate): 85,000.
Area: 8,866 square miles; 22,963 square kilometres.
Population density: 10 per square mile; 4 per square kilometre.

Summary of school statistics, 1953–57. In 1957 there were about 19,950 pupils enrolled in all schools, representing approximately 24 per cent of the population. Of total enrolment 93 per cent was in primary, 6 per cent in secondary general and under 1 per cent in vocational and teacher training institutions respectively. Girls represented about half the enrolment in primary and general secondary schools and two-thirds at the teacher training centre. Enrolment in primary schools increased by 26 per cent between 1953/54 and 1957/58. There were 383 primary school teachers in 1957/58, of whom nearly two-thirds were women, and the average pupil-teacher ratio was 49, compared with 54 in 1953/54.

Total enrolment in the eight general secondary schools increased by 23 per cent between 1953/54 and 1957/58 and

the number of girls by 11 per cent over the same period. In the vocational school, enrolment increased from 65 to 105 pupils in the period under review. The number of teachers in general secondary schools rose by 43 per cent between 1953/54 and 1957/58 and the pupil-teacher ratio fell from 20 to 17 over the same period.

Students in the post-secondary teacher training college rose from 18 in 1954/55 to 27 in 1957/58 of whom 15 were women. (See Table 2.)

Examination results in secondary education, 1953–57. The number of successful candidates for the London General Certificate of Education was 28 in 1957 compared with only 3 in 1954; in addition 54 candidates were awarded the Cambridge Oversea School Certificate and 7 the Cambridge Higher School Certificate in 1957. There were also 30 successes in the London Chamber of Commerce and 14 in the Royal Society of Arts examinations. In 1956/57, 18 students passed the teacher training final examination and in 1957/58, 13.

Educational finance, 1957. Total expenditure on education by the Central Government in the fiscal year beginning January 1957 was 758,619 British Honduras dollars or approximately $90 per inhabitant. Of this sum, 76 per cent ($573,133) came from territorial resources and the remaining 24 per cent ($185,486) from United Kingdom funds. Capital expenditure amounted to $117,120 or 15 per cent of the total. The distribution of recurring expenditure by level and type of education is given in Table 1.

2. Not including part-time staff.
3. Not including pupils in evening classes who numbered 70 (F. 22), 121 (F. 31), 168 (F. 22), 200 (F. 100) and 123 (F. 53) in the years 1953/54 to 1957/58 respectively.

BRITISH VIRGIN ISLANDS

The British Virgin Islands form the eastern extremity of the Greater Antilles and are geographically part of the Leeward Islands group. In 1956, each of the four presidencies (Antigua, Montserrat, St. Christopher-Nevis-Anguilla, and Virgin Islands) which at that time formed the Federation of the Colony of the Leeward Islands, became a separate colony by the Leeward Islands Act. The first three of these colonies are now part of the Federation of the West Indies, established on 3 January 1958, but the Virgin Islands have not joined the Federation.

The British Virgin Islands are administered by an Administrator assisted by an Executive Council and by a Legislative Council of 10 members (excluding the President), 6 of whom are elected.

THE EDUCATIONAL SYSTEM

Most of the schools are primary schools owned and operated by the Anglican and Methodist churches, but assisted by the Government which provides equipment and salaries. There are also a few 'assisted community schools'; these are small schools conducted by private persons, which receive grants-in-aid. There is one unaided school and a government secondary school, the only secondary school in the Colony.

The educational system is governed by the Education Ordinance (No. 11 of 1955). General control and supervision is exercised by the Education Officer, who is responsible to the Administrator of the Colony. There is also an advisory body, the Board of Education.

The primary school course lasts 9 years and caters for children in the 5 to 15 age range. The schools have been re-organized into infant departments (5–7), primary departments (8–12) and post-primary departments (12–15). A new curriculum has been circulated for use in the infant and primary departments and includes religious knowledge, language, mathematics, social and environmental studies, art and craft, and aesthetic subjects.

Primary school pupils between the ages of 11 and 14½ may sit the entrance examination to the government secondary school, which provides a 5-year course (forms 1 to 5), leading to the Cambridge Oversea School Certificate examination. The curriculum is largely dictated by the requirements of this examination.

For other types of formal schooling, pupils from the Virgin Islands attend institutions outside the Colony, notably Erdiston Teacher Training College, Barbados, and the Leeward Islands Teacher Training College, Antigua.

TRENDS AND PROBLEMS

A committee was appointed towards the end of 1956 to review the educational system of the Colony. As regards secondary education, the committee recommended *inter alia* the establishment of a secondary school committee to help with the management and general progress of the school. The committee also recommended that the method of selecting pupils and the curriculum be made more flexible. A common course should be devised for forms 1, 2 and 3. Form 4 should be divided into A and B streams, the former for the academic group, the latter for the non-academic group which would take vocational subjects in addition to English and a choice of other general subjects.

Work is proceeding on a new curriculum for the post-primary departments (12–15) which will give greater recognition to the needs of children in this age group, and provide in the initial stage a 2-year course leading to a local Post-Primary School Leaving Certificate.

STATISTICS

Population (mid-year 1958 estimate): 8,000.
Area: 67 square miles; 174 square kilometres.
Population density: 119 per square mile; 46 per square kilometre.

Summary of school statistics, 1953–56. In the school year 1956 there were 2,109 children enrolled in 17 primary and 1 general secondary school. Enrolment represented over a quarter of total estimated population. The proportion of girls to total enrolment in primary schools was about 50 per cent and in the secondary school 78 per cent. There were 69 primary school teachers of whom 57 were women and the average pupil-teacher ratio was 29. In the secondary school there were 7 teachers and the average pupil-teacher ratio was 15. (See Table 2.)

Examination results in secondary education, 1956. In 1956 there were 13 candidates for the Cambridge Oversea School Certificate compared with 5 in the previous year.

Educational finance, 1955. Total expenditure on education by the Central Government in the fiscal year beginning January 1955 amounted to 82,091 British West Indian dollars, or approximately $10.3 per inhabitant. Of this

total, 98 per cent ($80,219) was derived from territorial revenue and the remainder from United Kingdom funds. Capital expenditure by the Central Government was nil. The distribution of recurring expenditure by level and type of education is given in Table 1.

FALKLAND ISLANDS

The Falkland Islands, the only considerable group in the South Atlantic, consist of East Falkland, West Falkland, and upwards of 100 small islands. All the territory outside Stanley, the capital, is known as the Camp. The inhabitants of the Camp are mainly engaged in sheep-farming and live in scattered settlements. The remoteness of many settlements, the fact that some shepherds frequently move from one settlement to another and the difficulty of the communications have always been serious obstacles to the development of education. English is the only language spoken in the Falklands.

THE EDUCATIONAL SYSTEM

Under the Education Ordinance of 1947 parents are required to have their children educated wherever there is a recognized school and wherever classes are held by a recognized teacher. At present education is compulsory between the ages of 5 and 14, but school attendance is not required of Camp children between 5 and 7 if they live more than one mile from a school or of Camp children of any age if they live more than two miles away.

All schools are maintained by the Government. Stanley

has an infant school for children aged 5 to 7, and a senior school comprising junior classes for ages 7 to 11, senior classes for ages 11 to 14, and a continuation class offering two years of voluntary study after the statutory leaving age. In the Camp there are two boarding schools and a number of one-room settlement schools situated at farm settlements and staffed by travelling teachers. The Camp schools are all-range schools for children aged 5 to 14. Tuition is free in both Stanley and the Camp but parents of children attending boarding school pay £12 a year for accommodation and half the transport costs by sea or air.

The school system is administered for the Legislative Council by the Superintendent of Education who also acts as inspector of schools. He receives a report on each child three times a year and makes an annual supervisory visit to schools in the Camp. Education is financed from colonial revenue supplemented by grants from Colonial Development and Welfare funds.

THE DEVELOPMENT OF SECONDARY EDUCATION

Schools in the Falklands are organized so as to provide a course covering the period of compulsory education (5 to 14), and of this period the last three years may be considered to be at secondary level. Thus children who go on to complete the voluntary 2-year continuation course attain a standard comparable with the Ordinary level of the United Kingdom General Certificate of Education in a limited number of subjects. The curriculum of the Falkland Islands schools includes religious knowledge, English, arithmetic, history, geography, nature study, arts, music, games and physical education. Infants and lower juniors take arts and crafts, girls over the age of 8 take needlework and boys over the age of 8 take handwork and woodwork. In Stanley evening classes are held in winter, the subjects taught being shorthand, typewriting, mathematics, English, crafts and Spanish; attendance at these classes is compulsory for all government employees under 18 years of age. As yet there is no provision for technical education or training. Teacher training for a few girls who have completed the continuation class is conducted by a qualified teacher on the staff of the Stanley school.

Children in the continuation class learn to accept responsibility through the prefect system. All children have a games period once a week and there is limited provision for sports and other competitions.

Assistance is available for parents who wish to have their children of secondary school age educated outside the colony. Two scholarships are offered each year for education at boarding grammar schools in Dorset (United Kingdom); the scholarships cover the passage to England, board and lodging, and tuition. Government allowances are payable in respect of children between the ages of 11 and 18 who are being educated in any part of the British Commonwealth outside the Falklands, or in South America. The allowances are paid for five years—£150 in the first year and £100 in succeeding years.

TRENDS AND PROBLEMS

The main obstacle to the expansion and improvement of secondary education in Stanley is the difficulty of obtaining qualified staff. Certificated teachers holding senior posts are recruited in the United Kingdom, but the lower salaries in the Falklands make it difficult to compete with other colonies and the United Kingdom schools. The provision of secondary education for children in the Camp is linked with the development of boarding establishments. In this connexion there are plans for a new senior school in Stanley which will provide such accommodation.

FALKLAND ISLANDS. EDUCATION DEPARTMENT. *Annual report.* Stanley, Government Printing Office.

STATISTICS

Population (mid-year 1958 estimate): 2,000.
Area: 4,618 square miles; 11,961 square kilometres.
Population density: 0.4 per square mile; 0.2 per square kilometre.

Summary of school statistics, 1953–57. In 1957 there were 301 children enrolled in 11 all-range schools which provide a course of education from 5 to 14 years. The proportion of girls enrolled was approximately 50 per cent. Teachers numbered 28, of whom half were women, and the pupil-teacher ratio was only 11 owing to the scattered settlements with small schools in the Islands. There is no recent information on the breakdown of enrolment at primary and secondary levels enrolment within the all-range schools. (See table.)

Educational finance, 1956/57. Total public expenditure on education in the fiscal year beginning April 1956 was 28,462 pounds sterling representing about £14.2 per inhabitant. Of this sum £953 was contributed from the Colonial Development and Welfare funds and the remainder was derived from territorial revenue. Recurring expenditure amounted to £18,132, and an amount of £9,377 was reported as 'special expenditure'. Official exchange rate: 1 pound sterling = 2.80 U.S. dollars.

ST. HELENA AND DEPENDENCIES

The island of St. Helena lies in the Atlantic Ocean, about 1,000 miles south of the Equator and 1,200 miles off the coast of Africa. It is only 10½ miles long and has a maximum width of only 6½ miles, but because of the rugged and mountainous terrain some of the settlements are relatively isolated. The local population is of British, African and Asian descent. English is the only language spoken. The Governor alone issues ordinances, since there is no legislative body.

THE EDUCATIONAL SYSTEM

Since the Education Ordinance of 1941 all schools in St. Helena have been maintained by the Government through its Education Department. The school system provides education for children of compulsory age, i.e. between 5 and 15. This 10-year course is divided into 6 years of primary schooling, comprising infant and junior classes, and 4 years of secondary schooling taken in senior schools or at the secondary selective school. All institutions are co-educational; two of them are all-range schools having infant, junior and senior sections, the others are organized as primary or secondary schools. The Education Department also runs voluntary classes in a few vocational subjects for young people beyond the statututory school age and adults, and makes provision, based on the pupil-teacher system, for teacher training. The Department of Agriculture and Forestry, the Public Works Department and the Health Department have vocational training schemes which fit into the school programmes.

The school system is administered and controlled by an Education Officer who is responsible to the Governor of the Colony for the organization of education, the management and inspection of schools, and the training of teachers. He is advised by a Board of Education appointed by the Governor and comprising representatives of the Church and prominent citizens; in practice the board interprets government policy and formulates rules which are administered by the Education Officer. Departmental staff responsible for administration and teacher training are recruited from overseas.

All educational expenditure is met from government funds. Textbooks and essential equipment are provided by the Education Department. Standardization of school furniture was introduced in 1955; most of the children have individual desks and chairs made locally from termite-proof hardwood. The Public Works Department is responsible for designing and building schools and for their maintenance and repair.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education in St. Helena is coterminous with the last four years of compulsory schooling. At the senior schools emphasis is on practical education while the secondary selective school offers a more 'academic' curriculum. Selection of pupils for the latter type of course is guided by the results of the Secondary Selective examination, which is taken by all children between 10½ and 11½ years. This examination comprises papers in English, arithmetic and general knowledge.

Subjects taught at secondary level include English, arithmetic, history, geography, general knowledge, music, art, domestic science, lace-making, needlework, dress-making, woodwork, ropework, aloework, gardening and physical training. Religious instruction is given in all schools. Curricula and schemes of work are drawn up on the basis of a main scheme agreed by head teachers in January 1959, but which permits local variations determined by head teachers' special knowledge of their children and

districts. The schools have an adequate supply of textbooks, which are obtained from the United Kingdom.

All children over 14 sit for the St. Helena General Schools examination, which consists of papers in the first five subjects listed in the preceding paragraph. Certificates are awarded at two levels: 'pass' and 'pass with distinction'.

Facilities available for formal education beyond this certificate are limited to vocational and teacher training. Classes in woodwork, aloework, needlework and typing are provided by the Education Department, and in 1959 evening classes were started to prepare a small number of pupils for the examinations of two United Kingdom bodies —the Union of Educational Institutes and the Royal Society of Arts. The Health Department trains nurses and midwives, and there are apprenticeship schemes run by the Department of Forestry and Agriculture and the Public Works Department. The latter trains apprentices in carpentry, surveying, plumbing, maintenance of combustion engines, and metalwork. Teacher trainees at present start at 15+ as pupil teachers; they receive formal instruction for three hours each week and during holidays. It is intended that pupil teachers should continue full-time attendance at school until 16, at which age they would commence teaching. Since 1953 one locally trained teacher has been sent each year to a training college in England. In other fields, scholarships for study overseas are sometimes granted under the Colonial Development and Welfare Scheme.

To assist secondary school leavers in choosing an occupation and finding a job, the Employment Officer, in conjunction with the Social Welfare Officer, keeps a register for young people (15 to 18 years). He has access to school record cards and receives the collaboration of head teachers and local employers. As a rule, candidates for the more responsible posts in the Colony—teachers, apprentices, and clerks, etc., in Government offices and local firms are ex-pupils of the secondary selective school.

Among the extra-curricular aspects of secondary school life, emphasis is placed on the prefect system, the wearing of school uniforms and badges, and corporate activities which build up a sense of responsibility, initiative and co-operativeness. The playing of outdoor team games is handicapped by the lack of level ground; also, the time taken by many of the children to reach their homes makes it difficult for them to participate in activities after school hours. Transport is provided for all children living beyond a two-mile radius from their school, but even then some children at the secondary selective school have a further long walk over hilly roads. In addition to free transport, other social services for schoolchildren include free milk and fish oil capsules (supplied by Unicef), free meals for about a third of the children, and medical and dental supervision by officers of the Health Department.

TRENDS AND PROBLEMS

The main aim is to raise teaching standards through teacher training courses and the raising of the age at which pupil teachers commence work. Young teachers are also being encouraged to take external examinations, as are pupils in the secondary selective school.

The chief problem is to diminish the flow of experienced teachers from the Island.

TRISTAN DA CUNHA

Tristan da Cunha, a small group of islands midway between the Cape of Good Hope and South America, had a population in 1958 of 257.

Education is free, the salary of one of the two teachers being met from a Colonial Development and Welfare grant, and of the other from the Administration Fund which is partly financed by the Tristan da Cunha Development Company.

ASCENSION

Ascension, an island 700 miles to the north-west of St. Helena, had a population in 1958 of 326.

Daily tuition is provided free by Cable and Wireless Limited for the few children living there. The Government makes an annual contribution towards costs.

STATISTICS

Population (mid-year 1958 estimate): 5,000.
Area: 162 square miles; 419 square kilometres.
Population density: 31 per square mile; 12 per square kilometre.

Summary of school statistics, 1953–57. From 1954 to 1957 total enrolment in primary and secondary schools increased from 1,231 to 1,270 pupils; this increase was almost entirely due to the rise in the number of girls enrolled. (See Table 2.)

Examination results in secondary education, 1957. In 1957, 72 candidates successfully passed the St. Helena General Schools Certificate which is a lower general secondary examination taken by children aged 14 years or over.

1. EDUCATIONAL FINANCE, 1957 (in pounds sterling)[1]

Other instructional	1 288	9.4

1. Official exchange rate: 1 pound sterling = 2.80 U.S. dollars.

Educational finance, 1957. In the fiscal year beginning January 1957 total expenditure on education amounted to 13,991 pounds sterling, including £233 for capital expenditure. All this money was derived from United Kingdom funds, except £42 contributed by voluntary agencies. Apart from this expenditure, £32,730 had been allotted for a school building programme, of which £16,416 had been earmarked by the end of 1957. The distribution of recurring expenditure by level and type of education is given in Table 1.

1. Including pupil teachers and part-time teachers. In 1957 there were 21 pupil teachers (F. 19) and 1 woman part-time teacher in primary schools, and 4 pupil teachers (F. 2) and 2 women part-time teachers in secondary schools.
2. Including secondary schools.
3. In addition there were a number of vocational courses and part-time teacher training courses. In 1957 the former enrolled 79 pupils (F. 62) and the latter 67 (44 teachers and 23 pupil teachers).
4. Selective secondary school only.

FEDERATION OF THE WEST INDIES

THE EDUCATIONAL SYSTEM

Free primary education is provided in elementary schools which cater for pupils between the ages of 7 or 8 and 14 or 15. Infant schools exist in comparatively small numbers. Many secondary (grammar) schools possess a preparatory department which may contain both infant and primary sections; most of them contain only the latter.

At secondary level the grammar schools provide the majority of entrants to university and supply the needs of the civil service and the professions. Grammar school education involves the payment of fees, though a large number of scholarships are available. Pupils are recruited by competitive examination from the elementary schools between the ages of 9 and 13 or from the preparatory department of the grammar schools themselves. In Jamaica, the Government provides about 2,000 free places annually. Everywhere there are government-assisted as well as private schools. The majority of government-assisted schools are owned by religious denominations; some are in connexion with old endowments.

Elementary schools are being increasingly reorganized and provided with facilities, so that suitable post-primary education may be given either in separate schools or in senior departments of all-age schools. In the larger territories there are technical institutions which cater for older pupils. In Jamaica and Trinidad higher vocational education is provided in technical and agricultural colleges.

The standard of entry to these colleges may be a (grammar) school certificate or some other evidence of adequate general education. In general, and with the possible exception of Barbados, the number of pupils leaving secondary schools is below the needs of the territories.

Education is provided under the law in all territories, and as they advance constitutionally the subject is more and more being placed under the supervision of a Minister responsible for policy. All education is conducted in English, which is the language of the Federation, though a handful of people in St. Lucia use a French patois. Public education is provided without reference to race, religion or class. Education is the responsibility of Central Governments; local authorities may provide scholarships and assist in health education and in certain minor requirements. Private agencies are free to establish schools provided they conform to certain minimum standards.

The structure of the school system is shown in the diagram on page 1326.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education, emerging through voluntary action, has been influenced by the concept that it was something quite distinct from elementary education and serving a different social class. Thus in Jamaica and Barbados the oldest schools which today have the greatest prestige began two centuries ago as schools for white children (often the poor of the district). As time went on these schools became fee-paying and taught a curriculum which included the classics, mathematics, science and foreign languages. Distinct form was given to the education in those schools (and in others for which they became the prototypes) with the introduction of the Cambridge Oversea School Certificate examinations in the early 1880s. It is only recently that secondary education has been thought of in terms of child development, and the term 'secondary' is still widely understood as 'grammar'. Late in the nineteenth century many secondary schools were placed under some measure of government direction, and received government assistance, while remaining under private control. Some government-owned schools were established. For a long time—and in most territories up to the present day—the administration of secondary education was entirely separate from the administration of elementary education.

The provision of vocational education began in the elementary schools with the study of practical agriculture and handicraft. Technical schools are of comparatively recent development. The Kingston Technical School (Jamaica) was, however, opened before 1900.

The legal foundation of secondary education was laid well before 1900, and since the turn of the century there has been a gradual expansion in the provision of schooling to catch up with the increasing population. After the first world war, there was some recognition of the importance of science and of the need for practical subjects like domestic science and handicraft, though even today schools exist which make no provision for these subjects on any satisfactory scale. Since the second world war efforts have been made to bring education more into line with environmental needs, an aim more successfully realized in the vocational and general types of secondary education than in the academic; the West Indies are still in the midst of this development. In recent years, in order to meet the needs of industry and the Civil Service, there has been a rapid expansion of both academic and technical education.

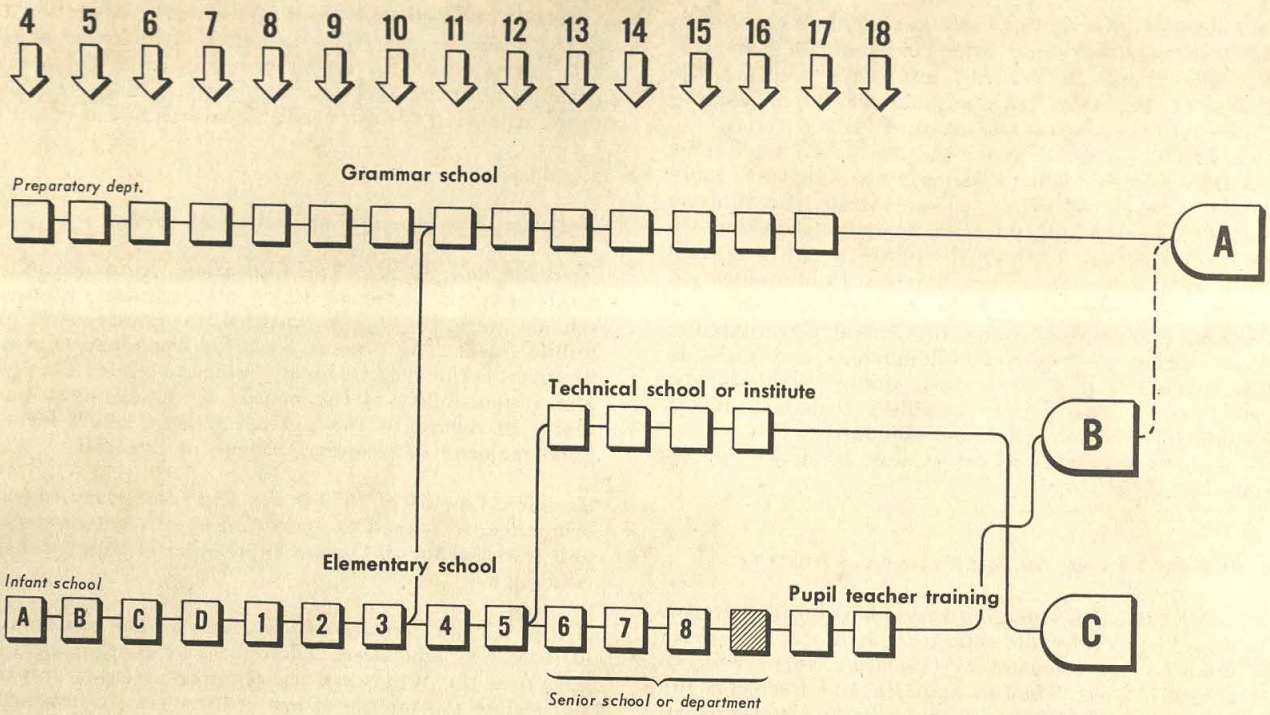
Legal basis

Barbados. The principal act is that of 1890.

Trinidad and Tobago. The Education Ordinance of 1870 established the basis on which all secondary (grammar) schools were to become entitled to grants-in-aid from public funds. The present basis for secondary education, however, is the 1933 Ordinance which extended the powers and responsibility of the boards of management, particularly in regard to the assisted schools which form the great majority of secondary schools in Trinidad.

Jamaica. Law 34 of 1879 is the basic secondary education ordinance; it defined the government of secondary schools and provided for the better application of endowments for education.

Windward and Leeward Islands. Acts for the establishment of secondary education in one form or another have been passed in the Windward and Leeward Islands at various times since the middle of last century (in 1857 an act was passed in Grenada, in 1878 in St. Vincent).



Laws about compulsory education have been on the statute books of various West Indian territories from the 1880s (Grenada 1888, the Leewards 1890, Jamaica 1892, Trinidad 1921); nowhere, however, has compulsion been adequately enforced. In all the territories there have of course been numerous amendments to the laws to increase the provision of scholarship for secondary schools and to bring school government into line with constitutional changes.

There is legal provision for apprenticeship along modern lines. Informal procedures are only slowly giving way to recognized contracts.

Administration

In government schools ultimate control rests with the Department of Education. In Trinidad the Department is assisted by an advisory body in running such schools but in some other territories a government school may be operated by a statutory board—the latter is the normal pattern in Jamaica. Government grants are paid to the managing bodies of assisted schools, whose accounts are carefully examined. The salaries of teachers in both government and assisted schools are guaranteed by the Government and are paid in accordance with government scales. In Jamaica there is a system of supervision and inspection of secondary schools; for schools of the general and vocational type there is regular inspection everywhere.

In all territories the educational policy is determined by the Minister of Education, who is assisted by his technical advisers and by advisory bodies. There is a minimum control of curriculum which is only in the broadest sense referred to in laws. The grammar schools follow the

GLOSSARY

NOTE. The accompanying diagram is intended to show the basic pattern of schooling throughout the Federation of the West Indies. Entry age and length of school life vary from territory to territory.

elementary school: originally an 'all-age' school providing a terminal course of general education for pupils not transferring to grammar schools; being reorganized into primary and secondary stages, the latter provided in separate *senior schools* or *senior departments* of all-age schools.

grammar school: general secondary school with academic type of course preparing for university entrance.

infant school: pre-primary school.

preparatory department: pre-primary and primary classes attached to a grammar school.

senior school or department: general secondary school with non-academic course based to some extent on environmental needs. (See *elementary school.*)

technical school or institute: vocational secondary school.

A. University education at the University College of the West Indies or in institutions overseas (United Kingdom, Canada and the United States of America).

B. Teacher training colleges.

C. Technical and agricultural colleges.

Cambridge Local (or the Oxford and Cambridge GCE) syllabuses, some of which were drawn up by bodies of local professionals. The secondary schools of a general character follow courses drawn up either by professional committees appointed by the Department of Education or by the school staff. Educational methods are worked out between government departments and the schools themselves, assisted by professional bodies. There is in Jamaica a recently established Schools Publications Branch working under the Ministry of Education.

Ministries and departments exercise control through personal contact with the schools, and through the boards of governors and heads of schools. Heads of schools are freely in charge of the day-to-day operation.

Supervision and inspection of academic schools is performed by men and women of good academic and professional qualifications and educational experience; such persons are recruited from school staffs or borrowed from the University College.

Public funds are provided by votes of the legislature in the case of government schools. When not directly administered by ministry officials sums of money are paid direct to governing bodies. Building and equipment are financed in accordance with specific regulations; generally speaking, assisted schools may be as well provided as government schools. In all academic secondary schools and in some technical schools pupils are required to pay nominal fees. Pupils may be assisted in the provision of books, mid-day meals, boarding, and in regard to general maintenance. Scholarships and free places are provided in each territory to the extent that may be possible.

As regards buildings and equipment, standards are high though varying with the circumstances of schools.

In a large number of non-academic schools free milk and

biscuits are distributed and some medical assistance is provided; most schools of this kind in Jamaica have a lunch canteen where hot meals are served daily; some grammar schools also provide this service.

TYPES OF SECONDARY EDUCATION

The following types exist: grammar schools; senior departments of elementary or all-age schools, or separate senior schools of the same kind where the education is general; vocational and technical schools. In the larger territories evening classes are available, where a wide range of subjects both academic and practical is provided.

In Jamaica and Barbados the school year begins in September with breaks at Christmas and Easter and a long summer vacation; in Trinidad the school year begins in January and there are two terms of 12 weeks and one of 13. Generally there are five days to the week. The length of the school day varies; school opening time ranges between 8 and 9.15 a.m. and the closing hours range from 1 to 3.30 p.m.

General secondary schools

The selection of grammar school entrants, the nature of the course provided and the destination of leavers have already been mentioned.

In Barbados grammar schools may be of the first or second grade. First grade schools have highly qualified staff and offer wide sixth form courses. In Trinidad an intermediate school takes some pupils beyond the general training associated with elementary schools, up to the Cambridge Oversea School Certificate.

The bulk of secondary education in the West Indies consists of senior (elementary) schools or departments which provide education of a general kind. An increasing number of such schools are developing academic sides for the brighter pupils where training leading either to a local certificate or to an overseas General Certificate of Education in a limited number of subjects may be possible. Growing attention is also being paid to the provision of courses in practical subjects including agriculture. There are a few vocational schools with a rural or a technical bias. These schools aim at standards equivalent to the overseas GCE. The use of individual record cards is growing.

The University College of the West Indies trains teachers for the secondary schools, the Department of Education offering a diploma course which is open to graduates.

Vocational and technical schools

In Trinidad, Jamaica and Barbados there are expanding opportunities for technical and commercial training. Part-time training is available through day release and evening classes. In Trinidad a peripatetic instructor takes classes for day release apprentices. There are schools for agriculture which embrace both secondary and post-secondary levels of work. Domestic science training is provided at vocational, secondary and professional (teaching) levels. Big private industrial concerns provide their own training systems. There is widespread use of informal apprenticeship, though provision for legalized apprenticeship under modern terms exists in the larger communities.

Teacher training schools

Teachers' colleges recruit students who have obtained an overseas School Certificate or some local equivalent and are therefore largely outside the scope of the present report. In some parts there is also a pupil-teacher system for teachers recruited direct from elementary schools.

Other specialized schools

There are one or two institutions where part-time tuition is given, e.g., the Jamaica School of Art and Crafts; similar courses (in drama, public speaking, literacy, academic subjects, etc.) are provided in various adult education schemes.

Out-of-class activities

There are numerous school clubs supervised by teachers and plenty of free experimentation in the participation of pupils in school government. The prefect system is widely used. Physical education and games are provided generally on an adequate scale and performance is often of a high order.

TRENDS AND PROBLEMS

Consideration is now being given to certain changes in the control of the overseas School Certificate examinations which in due course may have important repercussions upon the curriculum.

Local production of textbooks suitable for West Indian pupils is gradually increasing.

There is a growing realization of the need for schools to adjust themselves to the demands of political and constitutional changes.

STATISTICS: BARBADOS

Population (mid-year 1958 estimate): 235,000.
Area: 166 square miles; 431 square kilometres.
Population density: 1,416 per square mile; 545 per square kilometre.

Summary of school statistics, 1953–57. In 1956/57, enrolment in all educational institutions from primary to university level numbered some 41,000 pupils, representing about 18 per cent of the total population. Of total enrolment, over 90 per cent were pupils in primary schools, 8 per cent in general secondary schools, 1 per cent in vocational training centres and the remaining 1 per cent in higher educational institutions including the teacher training college. Girls made up about 49 per cent of primary school enrolment and one third of general secondary school enrolment. There is no recent information available on numbers of teachers employed at the different levels of education. Compared with 1953/54 enrolment had increased by 12 per cent in primary schools in 1957/58. Enrolment in general secondary schools appears to have declined substantially over the period under review. The number of students training to be teachers, however, increased from 34 in 1953/54 to 100 in 1956/57. (See table.)

Educational finance, 1957. The total reported expenditure on education in 1957 was 3,525,000 British West Indian dollars of which $2,727,000 was for recurring and $798,000 for capital expenditure. There was in addition a financial contribution to education from metropolitan government funds but no details are available. Official exchange rate: 1 British West Indian dollar = 0.583 U.S. dollar.

1. Public schools only.
2. Enrolment in senior departments of primary schools is included under primary education.
3. Not including non-aided private schools.
4. Including secondary and vocational education.
5. Aided private schools only.

STATISTICS: JAMAICA

Population (mid-year 1958 estimate): 1,646,000.
Area: 4,677 square miles; 12,113 square kilometres.
Population density: 352 per square mile; 136 per square kilometre.

Summary of school statistics, 1953–57. Total estimated enrolment in public and aided primary and secondary schools in 1957/58 was about 254,000 pupils, representing some 16 per cent of the population. Data on unaided private schools are not available. Of these pupils nearly 95 per cent were in primary schools, under 5 per cent in general and teacher training secondary schools and about 1 per cent in technical secondary schools and agricultural centres. Girls made up half the enrolment at primary and general secondary schools and about three quarters of the enrolment in teacher training colleges. There were 566 students, of whom 202 were women, at the University College of the West Indies. Details of school teaching staff are incomplete; it appears that the pupil-teacher ratio in primary schools was unchanged at about 52 over the period 1953–57. In 1956/57 there were 559 teachers in all secondary schools of whom 60 per cent were women. The pupil-teacher ratio in 1956/57 was about 18 in general secondary and teacher training colleges and 23 in technical schools. Compared with 1953/54, enrolment in 1957/58 had increased by 10 per cent in primary schools, by 45 per cent in both general secondary schools and teacher training colleges and by 2 per cent in vocational education. (See Table 2.)

Examination results in secondary education, 1954/55. During 1954/55, the only year for which data are available, 892 students passed the Cambridge Oversea School Certificate, and 201 the Cambridge Higher School Certificate.

Educational finance, 1954. Total public expenditure on education in 1954 was 2,677,818 Jamaican pounds, or about £1.8 per inhabitant. Nearly 93 per cent of receipts (£2,485,029) were derived from territorial revenue, 5 per cent (£140,061) from United Kingdom grants, and the remaining 2 per cent (£52,728) from local authorities. About 12 per cent (£309,974) of the total spent was capital expenditure. Recurring expenditure by level and type of education is shown in Table 1.

2. Data on teacher training are included with general secondary schools.

STATISTICS: LEEWARD ISLANDS (ANTIGUA, MONTSERRAT, ST. KITTS-NEVIS-ANGUILLA)[1]

Population (mid-year 1958 estimate): 129,000.
Area: 356 square miles; 921 square kilometres.
Population density: 362 per square mile; 140 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment in all schools in Antigua, Montserrat and St. Kitts-Nevis-Anguilla was about 29,218 in 1957 representing 23 per cent of the estimated population. Girls made up about half the total enrolment in primary and general secondary schools. The teaching staff, including pupil teachers, numbered at least 735 in primary schools in 1956, the average pupil-teacher ratio being about 37. Two teacher training schools were reported in 1956 with 25 students, of whom 12 were women; data for 1957 are incomplete. (See Table 2.)

Examination results in secondary education, 1953–57. Details of candidates passing examinations are not complete for all years. From the figures available it appears that between 25 and 30 candidates pass the Cambridge Higher School Certificate each year and that the number of students awarded the Cambridge Oversea School Certificate increased from 87 to 130 between 1953/54 and 1956/57. Twenty-two teaching certificates were awarded in 1956/57. There were, in addition, a number of candidates for Matriculation Exemption, the General Certificate of Education of London University and examinations of the Royal School of Music.

Educational finance, 1956. Total expenditure on education in 1956 was 1,137,198 British West Indian dollars or about $9 per inhabitant. Nearly all this money was derived from territorial revenue, but approximately 7 per cent was contributed from United Kingdom funds and other sources. Capital expenditure amounted to about 3 per cent of the total spent. (See Table 1.)

STATISTICS: TRINIDAD AND TOBAGO

Population (mid-year 1958 estimate): 789,000.
Area: 1,980 square miles; 5,128 square kilometres.
Population density: 398 per square mile; 154 per square kilometre.

Summary of school statistics, 1953–57. Enrolment in 1957 in primary and secondary schools and teacher training colleges was about 183,100 pupils, representing some 23 per cent of the total population. Over 91 per cent of these pupils were enrolled in primary schools and 8 per cent in general secondary schools. Girls made up just under half the enrolment in primary schools and over 40 per cent in general secondary schools and teacher training colleges. The teaching staff in public and aided primary and secondary schools in 1957 numbered 5,129, over half being women. The average pupil-teacher ratio improved considerably over the period under review, being about 36 in primary schools and 26 in secondary schools in 1957, compared with nearly 41 in both types of schools in 1953. Compared with 1953, enrolment had increased in primary schools by 18 per cent and in general secondary schools by 35 per cent. (See Table 3.)

Examination results in secondary education, 1954–56. Candidates passing the Cambridge Oversea School Certificate numbered 1,452 in 1957, representing an increase of 20 per cent compared with 1954. There were also a considerable number of candidates for the Cambridge Higher School Certificate, the General Certificate of Education and for City and Guilds of London examinations. The number of students obtaining teaching certificates in 1957 was 12 per cent higher than in 1954. (See Table 2.)

Educational finance, 1956. Total expenditure on education in the fiscal year beginning in January 1956 amounted to 12,870,584 British West Indian dollars, representing about $17 per inhabitant. Of this sum $12,789,926 was derived from territorial revenue; under 1 per cent of the total was contributed by the Colonial Development and Welfare Fund ($75,613) and the Board of Industrial Training ($5,045). Capital expenditure was about 4 per cent ($455,958) of the total spent. The distribution of recurring expenditure by level and type of education is given in Table 1.

STATISTICS: WINDWARD ISLANDS (DOMINICA, GRENADA, ST. LUCIA, ST. VINCENT)

Population (mid-year 1958 estimate): 330,000.
Area: 826 square miles; 2,138 square kilometres.
Population density: 400 per square mile; 154 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment in primary and secondary schools in 1957 numbered 73,156 representing over 22 per cent of the estimated population. There were in addition pupils in certain private unaided schools for which details are not available. Of the total enrolled, over 94 per cent were in primary, 5 per cent in general secondary and less than 0.5 per cent in teacher training centres. Girls made up about half the enrolment in primary and secondary schools and nearly two thirds of enrolment in teacher training centres. The teaching staff in primary and general secondary schools numbered 1,793 in 1957, of whom 57 per cent were women. The average pupil-teacher ratio was 43 in primary and 22 in general secondary schools. Compared with 1953 enrolment had increased by 15 per cent in primary schools, by 33 per cent in general secondary schools and by 124 per cent in teacher training centres. (See Table 1.)

Examination results in secondary education, 1953–57. The information available on examination results is very incomplete for recent years. Nearly 200 pupils passed the Cambridge Oversea School Certificate in 1957 and 33 the Cambridge Higher School Certificate. These results exclude those for St. Lucia, which are not available. Twenty-four candidates from St. Vincent took the Royal Society of Arts examination in 1957 compared with only four in 1953. Teaching certificates were awarded to 84 candidates in 1953/54, the latest year for which complete data are available.

Educational finance, 1957. Total expenditure on education in 1957 was 2,358,736 British West Indian dollars, or approximately $7 per inhabitant. It appears from the limited data available that a major proportion of revenue for education was contributed from territorial resources. In Dominica, United Kingdom funds represented 7 per cent of the total spent and voluntary agencies contributed 13 per cent. In St. Vincent, over 99 per cent of the expenditure came from territorial revenues. The distribution of expenditure by level and type of education is available only for Dominica and St. Vincent. The figures are given in Table 2.

CYPRUS

THE EDUCATIONAL SYSTEM

Education is the responsibility of the Central Government. It is administered by the Education Department, all the officers of which are government officials, in accordance with the provisions of the Elementary Education Law Cap. 203 of 1933, the English School Law Cap. 204 of 1935, and the Secondary Education Law Cap. 205 of 1936, and the regulations made under these three laws.

The provision of education in Cyprus is necessarily affected by the mixed population of the Island. This consists of Greek-Cypriots (78.8 per cent), Turkish-Cypriots (17.5 per cent), Maronites (0.5 per cent), Armenians (0.94 per cent) and others. At primary education level community schools are divided between these four communities. There are in addition a number of private elementary schools, some of them run by religious foundations, which accept children from all communities. At secondary level, there are Greek-Cypriot and Turkish-Cypriot schools, no Maronite schools, one Armenian school and a number of government and religious secondary schools which are inter-communal.

Pre-elementary school education is entirely in private hands, the age group 3–6 being covered by private nursery schools and kindergartens. Primary education, which covers the age range 6–12, is primarily based on a community system, separate schools, nominated school committees, and educational advisory bodies being maintained in connexion with Greek-Cypriot, Turkish-Cypriot, Maronite and Armenian education. Secondary education covers the age range 12–18, although older pupils may be found in the secondary schools, and again this is primarily organized on a community basis, with the qualifications noted above. The only post-secondary educational institution in Cyprus is the Teacher Training College, which accepts students who have completed a secondary school course and obtained certain qualifications for a 2-year course of training as elementary schoolteachers. Cypriot students who wish to continue their education beyond secondary school level, and who do not intend to train as elementary schoolteachers, have to go abroad to do so.

There is no compulsory education.

THE DEVELOPMENT OF SECONDARY EDUCATION

The history of elementary education in Cyprus since 1878 shows a steady advance of centralization, with its

accompanying homogeneity and progress. The history of secondary education is, however, very different. Prior to the British occupation there was on the Greek-Cypriot side a central secondary school with branches in Limassol and Larnaca and one Turkish-Cypriot secondary school in Nicosia. The Order of the Sisters of St. Joseph of the Apparition had also established a school in Larnaca in 1844.

The Pancyprian Gymnasium in its present form replaced the central secondary school of Nicosia in 1893, and its establishment was followed in due course by the establishment of Greek-Cypriot community secondary schools in the district towns of Limassol, Famagusta, Larnaca, Kyrenia and Paphos; and the last 50 years has seen a steady increase in the number of Greek-Cypriot secondary schools in towns and in the larger villages. On the Turkish-Cypriot side, a secondary school for girls was founded in Nicosia in 1901 and thereafter there was a similar expansion of Turkish-Cypriot secondary education in the larger towns and villages. A number of private schools, some with a commercial bias, were also founded in the latter part of the nineteenth century. These included the English School in Nicosia. In the early years of the twentieth century the Franciscans founded the Terra Santa schools in the main towns, and the missionaries of the Reformed Presbyterian Church of America established the American academies, one in Nicosia and one at Larnaca. In general the Government had little say in managing secondary schools.

The first step in the centralization of secondary education was taken in 1936 when the Secondary Education Law Cap. 205 was passed. Details of this law are given below. The next step was taken by the Government in 1952 when an amendment was made to the Secondary Education Law comprising an offer to every secondary school's governing body for their school to become a public-aided secondary school. This meant that the Government would pay the salaries and pensions of the teachers out of the public revenue, but that schools could fix fees higher than a given maximum.

Administration

Whereas the elementary schools are largely homogeneous in methods, finance, staffing, control and physical conditions, almost every secondary school is, for practical purposes, a law unto itself. A school may be in one grouping for curriculum, another for method of governing, and yet a third for finance, the only common denominator being that they all cater for children between the ages of 12 and 18. This wide variety has to be borne constantly in mind.

Planning and policy. Subject to the control exercised by the Education Department under the Secondary Education Law, noted below, planning and organization for secondary education is in the hands of the various school committees, except of course for government schools which are directed by the Department of Education. Most of the Greek-Cypriot schools are aligned to the organization of secondary schools in Greece so as to obtain recognition by the Greek Ministry of Education. They follow exactly the lines laid down by the Ministry in matters of curriculum, methodology, textbooks and syllabuses, and a Cypriot pupil who obtains the leaving certificate of a fully recognized gymnasium in Cyprus is admitted to Athens University without further examination. On the Turkish-Cypriot side there is a similar alignment with Turkey; the schools are recognized by the Turkish Ministry of Education, and follow closely the Turkish pattern. Private schools have a wide variety of curriculum and approach, on a purely individual basis.

Control. The Secondary Education Law Cap. 205 requires every secondary school to be registered by the Director of Education, and every secondary school teacher to be licensed by him. Before any school can be registered it must meet certain standards as regards physical conditions, staffing and financial arrangements. The director must also satisfy himself that there is need for such a school. Similarly, academic and professional qualifications are required before a teacher can be granted a licence to teach in secondary schools.

In the main towns, community secondary schools are administered by committees appointed by the Governor, and the powers and duties of these committees are prescribed by law. In community schools outside the main towns, and in all private schools, the control of the school is left in the hands of the committee concerned, subject to their maintenance of the standards required by law.

Government schools are controlled from the Department, normally through a board of management nominated by the Governor.

Supervision and inspection. There is at present a Chief Inspector of Schools, who deals with Greek-Cypriot and inter-communal schools, and a Chief Inspector of Turkish Schools. Each of these has an elementary school inspectorate and a secondary school inspectorate. The total strength of the Inspectorate of the Education Department is at present 40.

Inspectors are normally recruited from the teaching profession; some have United Kingdom qualifications, both graduate and non-graduate, and a number of specialist inspectors have graduate qualifications obtained in Greece and Turkey.

The function of the Inspectorate has been for years past the raising of the standard of teaching in the schools by regular visits and advice to teachers, combined with an elaborate system of vacation courses, the results of which are followed up in the schools. There has been, since 1956, a system of general inspections of schools, with the object of assessing the work of the school as an educational unit, in all its aspects.

Finance. Government inter-communal schools are financed entirely by the Central Government, which supplies the buildings, appoints and pays the teachers, and meets the running costs of the schools. Government assistance is given to secondary schools in two ways. Ten secondary schools are in receipt of an annual block grant from the Government, which was fixed in 1948. This is a limited form of financial assistance. The school committee appoints and pays its own teachers and is responsible for its own buildings and its running costs. Another 10 schools are public-aided secondary schools, where the Government

appoints and pays the teachers, and the school committee supplies and maintains the buildings and meets the running costs of the school.

Except in the case of government inter-communal schools, buildings and equipment are financed by the school committee concerned. Except in the government inter-communal schools and the public-aided secondary schools, teachers are appointed and paid by the different school committees.

In Cyprus all secondary education is fee paying, the amount of the fees and their method of computation varying widely between one school and another. Assistance to parents is given in some schools and not in others. Here again, there is no uniform system. In many of the Greek-Cypriot secondary schools there is a sliding scale of fees applied according to the parents' means, and in certain cases free places may be provided. In government inter-communal schools and in public-aided secondary schools 20 per cent of all school places are free.

Buildings and equipment. The standard of building and equipment varies greatly, although the most modern schools compare favourably with schools anywhere in the world. In recent years in particular, as a result of the political situation in Cyprus, overcrowding has become general. Another general fault is the lack of provision of practical rooms, special subject rooms, etc.

TYPES OF SECONDARY EDUCATION

The pupil who has completed the primary school proper either finishes his school career at that point or proceeds to a secondary school. In the latter event he has two main choices: either to go to a secondary school of his own community or to go to one of the inter-communal schools run by the Government or by the various religious foundations. A Greek-Cypriot, if he opts to attend a Greek-Cypriot community school, has a choice of two main types of secondary school. The first, and by far the most common, is the Greek gymnasium; alternatively, he may go to a commercial school, the majority of which in Cyprus are privately run.

A Turkish-Cypriot, if he elects to go to a Turkish-Cypriot secondary school, will follow the academic curriculum of the *orta okul* for the first three years of his course; thereafter, for a further three years, he has a choice of the *lycée* course, or the so-called 'college' course (described below).

An Armenian may, after leaving primary school, go to the Melkonian Institute, the only Armenian secondary school in the Island. This is essentially a Middle East school, offering a general education for Armenians from all countries of the Middle East.

The primary school leaver who does not propose to attend one of the secondary schools of his own community has three choices. He may attend one of the two government English schools, which offer a 6–7 year course on English grammar school lines leading to the local Cyprus Certificate of Education and working on to the Advanced level of the General Certificate of Education. Alternatively, he may attend one of the four government technical schools, now in process of development, which have both academic and trade streams. The third choice for the primary school leaver is attendance at one of the secondary schools run by religious foundations. These have no common denominator in curriculum and syllabus, although some of them now provide courses leading to the examinations of the Cyprus Certificate of Education. They offer a general education, in some cases a certain amount of commercial studies, aimed neither at Cyprus conditions, nor at specific external examinations.

All the types of secondary education mentioned above are full-time courses. Part-time secondary education consists only of evening classes usually in specific subjects of the Cyprus Certificate of Education or the General Certificate of Education run by the Government.

The organization of the secondary school year varies from school to school, even within the same community, as terms and holidays are frequently adjusted to meet local conditions. Broadly speaking, secondary schools begin the school year at various times between early September and early October, and close between mid-June and early July for the summer vacation. Greek-Cypriot, Armenian and inter-communal schools work a three-term year, with breaks at Christmas and Easter; the Turkish secondary schools work a two-term year with a break normally in February. Holidays vary from school to school; these are most often religious, and are affected by the number of Saints' days celebrated in the Island. In most cases schools in Cyprus work mornings only, but there is an increasing tendency to introduce afternoon classes, or at least afternoon extra-curricular activities.

General secondary schools

Greek gymnasia. These are patterned on the Greek gymnasia with certain minor adaptations to Cyprus conditions. Their aim is to provide a full general education. Pupils are now admitted without any process of selection. There is no grouping in courses, classes or streams by ability or aptitude.

The present curriculum of one of the largest gymnasia in the Island is shown in the first table on page 1338.

Teaching in the gymnasia is normally in Greek, the approach being theoretical and academic, and the emphasis being on memory work. Attainment testing is by daily oral examination, for which a mark is recorded each day, and three written examinations per annum. Reports on pupils are submitted to parents at a meeting, where parents may discuss particular points with staff. Promotion is in accordance with the detailed regulations of the Greek Ministry of Education.

A number of gymnasia attempt to supply elementary commercial education. This does not take the form of re-alignment of the curriculum but of the addition to it of, say, three periods of book-keeping per week and two periods of typewriting in each of the top two classes.

Greek commercial schools. These schools do not set out to be vocational; rather are they bilateral in character, and in most cases have a gymnasium stream. There is one such community school, the Pancyprian Commercial Lyceum in Larnaca, the other commercial schools being under private

management. The curriculum of one of the chief private commercial schools includes religion, Greek (ancient and modern), Latin, English, French, mathematics, commercial subjects, science, geography, history, typewriting, and physical education. Commercial subjects and typewriting are taken only in the last three years of the 6-class course.

Turkish schools. The first three years in all Turkish secondary schools in the Island are based on the curriculum of the Turkish *orta okul*, modified to include English and sometimes Greek. The second three years of the secondary course follows in some cases the Turkish *lycée* curriculum with its literature and science streams. Most of the Turkish secondary schools however make provision for courses specially adapted to Cyprus needs, which are called 'college' courses. These prepare pupils for the government examinations, or for the General Certificate of Education examinations of London University, or give a 3-year commercial education. In no cases are they specialized commercial schools; the aim is rather to give a broad general education starting on traditional Turkish academic lines, and later developing according to the needs of the pupils.

Selection to the Turkish secondary schools is by entrance examination. There is a wide range of subjects. The level to which they are taught in the *lycée* section is that of the Turkish *Olgunluk* examination, the entrance examination for Turkish universities. The aims of the 'college' courses are specified above.

Teaching methods vary widely in the Turkish schools; in the *orta okul* and *lycée* parts of the school the formal methods of the original *lycée* are in common use, but a variety of methods is to be seen on the college side. Direction and guidance is generally given in the Turkish secondary schools by senior masters in charge of subjects, who occupy posts of special responsibility.

A sample curriculum of one of the major 6-class Turkish secondary schools (*lycée* section) follows.

Schools run by religious foundations. It is difficult to give any general description of these schools as they have no common factor. Their aim is a general education of the type considered desirable by the religious foundation concerned, with varying degrees of adaptation to local conditions and requirements. English and French tend to be stressed, together with religion, and, in certain cases, some pre-vocational commercial education.

Government inter-communal schools. There are in Nicosia three schools which do not fall in any of the above categories. The junior school is a school which accepts children of all nationalities in order to prepare them for the Common Entrance examination for 'public schools' in the United Kingdom. The English School for Boys and the English School for Girls in Nicosia accept pupils of all communities for a secondary education on English grammar school lines up to the Advanced level of the London General Certificate of Education (GCE). The language of instruction in the first two classes is the vernacular (Greek or Turkish) and thereafter English. The curriculum approximates to that of an English grammar school, due allowance being made for the native languages of the pupils and Cyprus conditions.

Recruitment and selection of pupils is by entrance examination, on a competitive basis. Within the schools pupils are grouped in streams according to ability and aptitude and in certain subjects the system of 'sets' is in operation. In general, teaching methods are those at present in use in the United Kingdom.

Written examinations are held three times a year, once at the end of each term, and reports based on the work of that term and including the written examination, are sent to parents. In addition, there is a system of periodic written

tests on a subject basis. Promotions are made by the headmaster on the advice of the form master concerned, and after consultation with class teachers.

Teaching staff. In the Greek schools, the general aim is to have teachers who have qualified at Athens University to take gymnasium classes. Owing to the shortage of teachers, however, school committees employ a number of teachers with lower qualifications, and some private schools have teachers with little more than a secondary education.

In the Turkish secondary schools the qualifications of teachers are generally satisfactory; a considerable proportion of the teachers are Turkish nationals seconded by the Turkish Ministry of Education.

In the religious schools some of the teaching is done by members of the religious institutions concerned; lay teachers are also employed.

In the Government inter-communal schools all specialist teaching is by teachers who hold university degrees.

The prospects of a teaching career vary according to the type of school in which a teacher is employed. In government schools the teachers are government officials, and the posts are permanent and pensionable; in the majority of Turkish schools, the teachers are also appointed by the Government and hold pensionable posts. In Greek schools teachers are appointed by the school committee concerned, and if the school receives a grant-in-aid from the Government, they qualify for a gratuity at the end of their service; if they are teaching in a school recognized by the Greek Government, however, they may qualify for a pension from that Government.

Vocational and technical schools

Most of the secondary school work which might loosely be called pre-vocational takes place in schools already listed under 'General secondary schools' above. A number of these are pre-vocational in that they prepare pupils for the examinations leading to entry to the Civil Service, or for the qualifications for entry to universities in Greece, Turkey or the United Kingdom, or give elementary commercial training to the boy or girl going into office employment.

The only specialized vocational training is in a number of government institutions. It is limited by the number and size of the schools concerned and by the recent development (three years ago) of the system of technical education now in use. In addition, there is a strong tradition of academic and classical learning in Cyprus, and a decided preference on the part of parents and children for the academic type of education. The tendency of commercial schools to develop academic streams has already been noted.

Commercial schools. These have already been dealt with under the section 'General secondary schools' above, as they are not strictly vocational or pre-vocational. Most private commercial schools offer evening classes.

Government technical schools. These are now in their third year of development, and have not yet reached the stage of full courses; they accept pupils from all communities. The language of instruction in the first two years of the course is Greek or Turkish, and thereafter English. The general structure is as follows. The first two (primary) years form a preparatory technical school for boys aged 12 to 14—this gives a general education, with a bias towards mathematics, science and handicrafts. At the end of these two years, a proportion of the pupils may leave (14 being the minimum age for entry into industry), while others will continue their course. Of the latter, the abler will take a secondary technical school course, normally a 6-year course (7-year for General Certificate of Education 'A' level), with a bias towards science and engineering. The remainder will embark on a special course designed for craftsmen, which lasts for a further 3 years after their 2-year preparatory course, a total of 5 years in all. A fairly wide range of trades is available, including mechanical and electrical engineering and the building trades.

Recruitment to these schools is by entrance examination.

Attainment testing, reporting to parents and promotion are as for English secondary schools in Cyprus.

Apart from specialist language staff, most of the teachers in the government technical schools have been trained in the United Kingdom, and the majority of the workshop instructors have also been recruited there owing to the shortage of qualified Cypriots. An extensive scholarship scheme is in operation to make good this shortage.

Agricultural schools. There are two rural central schools in the Island, one Greek and one Turkish, both run by the Government and both residential. These aim at giving a 2-year course for youths intending to work on the land, the entry age being between 14 and 16. The course is intended to be half theoretical and half practical, and working farms are attached to the schools.

The present curriculum at the Greek Rural Central School comprises Greek, mathematics, science, geography, history, religion, music, physical education, arts and crafts, English, rural science.

The curriculum at the Turkish Rural Central School, markedly influenced by that of the *orta okul*, comprises Turkish, history, geography, civics, mathematics, general science, agriculture, woodwork/metalwork, English, art, music, physical education.

Forestry. There is a Forestry College, run by the Forestry Department of Cyprus, which organizes courses for Forestry Department staff, adapted to the needs of the Island. It also offers advanced courses for forestry personnel from all over the Middle East. All these are specially planned short courses designed to cover some specific aspect of forestry, and therefore no typical curriculum for the college is available.

Teacher training schools

The only teacher training institution in Cyprus is the Teacher Training College, which is post-secondary and trains teachers for Greek and Turkish elementary schools. It is administered by the Government, and accepts students who have completed a secondary school course. It therefore does not properly come within the scope of this report.

Other specialized schools

Three specialized schools should be treated under this heading: the School for the Blind, the School for the Deaf, and the Reform School. All three institutions are intercommunal and residential, and are run by the Government. These are not truly secondary schools, but as they are the only institutions of their type in the Island they have to cover a fairly wide age range, and an appreciable proportion of their pupils at any one time are of secondary school age. They provide vocational instruction as well as a general education, and give definite training to the older pupils with a view to fitting them for employment on leaving the schools, e.g. blind pupils are trained as telephone operators, and deaf pupils as draughtsmen.

Out-of-class activities

In the government secondary and technical schools pupils play a fairly large part in school government and social life; there is a prefect system and a students' committee system on the lines of schools in the United Kingdom. In community schools the tendency is to limit the participation of pupils in the school government, and in many cases they do not participate at all. The range of out-of-class activities in secondary schools again varies from school to school. With few exceptions they lack adequate playing fields, but this is no deterrent. Cypriot youngsters enjoy their games and take their training and matches very seriously. Apart from sport, most secondary schools have cultural clubs and activities. Drama and debate particularly provide an excellent outlet for the Cypriot temperament. All schools, elementary and secondary, organize excursions and the bus tour of the Island for those finishing school is a great occasion. There are frequent trips to monasteries and shrines, to antiquities, and to mountain and seaside resorts. There are philatelic societies, and science societies, and often a school magazine. Scouting is very popular in the Island, where the movement began in 1913.

Mention should also be made of the important role played by the evening institutes. These institutes are numerous and popular, and although they are conducted by elementary school teachers, usually in elementary school premises, they are aimed at those of the secondary school age group (12 to 18) who do not in fact go to a secondary school. Members of these evening institutes meet three evenings a week for classes and indoor recreation and on Saturday or Sunday for outdoor games. Once a year there is a play or concert. The Education Department gives grants to these institutes to cover rent, equipment, and the fees of lecturers.

TRENDS AND PROBLEMS

It is difficult to give any accurate picture of the present general trends in education in Cyprus, as the normal development of education in the Island was disrupted by the events of the recent emergency. The problems facing education in the Island are however quite clear.

Perhaps the major educational problem is that of breaking away from the present rigid and academic forms of secondary education, and supplying in addition those forms of secondary, vocational and technical education which are suited to the needs and aptitudes of the majority of Cypriot children.

Associated with the problem of a wider range of curricula in secondary schools is that of separate provision of secondary education for girls.

There are very few schools where girls are taught separately and with a curriculum adapted to their needs. The shortage of teachers is particularly acute with regard to women teachers. Although girls make up 35 per cent of the secondary school pupil population, only 22 per cent of the secondary school teachers holding degrees are women.

Secondary education in Cyprus has developed very rapidly since the war, and the supply of qualified teachers has completely failed to keep pace with this development. Even before the emergency, secondary schools were often dependent on Greece and Turkey for the supply of teachers with full degree qualifications. In recent years there has been an ambitious scholarship scheme in operation, but the results are not yet visible in the schools, and such has been the recent increase in the secondary school population that it is doubtful whether the supply will even keep pace with the rate of development.

During the emergency there was a considerable slowing down in the normal expansion of secondary school buildings. Classes are frequently too large. The basic problem, however, is shortage of teachers and not shortage of teaching space.

STATISTICS

Population (mid-year 1958 estimate): 549,000.
Area: 3,572 square miles; 9,251 square kilometres.
Population density: 154 per square mile; 59 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 there were 799 primary and general secondary schools, 6 vocational schools, 2 public teacher training colleges and 3 special educational institutions. Total enrolment in these institutions was over 103,000 representing nearly 19 per cent of the total population. Enrolment in primary schools made up 78 per cent of the total, general secondary schools 21 per cent and all other institutions 1 per cent. In both primary and general secondary schools Greeks and Maronites were about 80 per cent of total enrolment and Turks between 18 and 19 per cent. The

increase in total enrolment in primary schools was 12 per cent between 1953/54 and 1957/58. The number of teachers in primary schools increased by 14 per cent between 1953/54 and 1957/58 and women teachers represent over one third of the total. The pupil-teacher ratio in primary schools was 38 in 1957/58 compared with 40 in 1953/54. Total enrolment in general secondary schools increased by 16 per cent between 1953/54 and 1957/58 and enrolment of girls by 43 per cent over the same period. The proportion of girls to total enrolment in general secondary schools was about 37 per cent for Greek children and 32 per cent for Turkish children. The pupil-teacher ratio in general secondary schools was 29 in 1957/58 compared with 25 in 1953/54. Enrolment of boys in vocational centres increased from 170 children in 1953/54 to 443 in 1957/58. In 1957/58 the two teacher training colleges enrolled 369 students of whom 27 per cent were women. (See Table 2.)

Educational finance, 1957/58. Total expenditure on education in the fiscal year beginning September 1957 was 3,138,939 pounds sterling, or about £5.8 per inhabitant. Some 73.5 per cent of receipts were derived from territorial revenue, 8 per cent from local authorities, 13 per cent from tuition fees, 3 per cent from the Public Loans Fund and the remaining 2.5 per cent from sale of property and donations. Capital expenditure (£577,961) was 18 per cent of the total spent. (See Table 1.)

1. Teachers in reform school are included with those in vocational education.

GIBRALTAR

THE EDUCATIONAL SYSTEM

The educational system comprises pre-primary, primary and secondary schools. For young people and adults the Education Department runs evening classes, and the Calpe Institute, a branch of the British Council, arranges informal educational activities. There is also an apprenticeship scheme for boys entering the public service. There are no facilities for higher education or teacher training, and students wishing to take post-secondary courses go to universities and colleges in the United Kingdom.

The pre-primary institutions are all private, fee-paying nursery schools which cater for children from 3 to 5 years of age.

Except for three private primary schools, all primary and secondary institutions are maintained by the Government. The primary course is for children aged from 5 to 11+. Secondary courses starting at 11+ vary in duration according to the type of course, as will be set out below. Education is compulsory between the ages of 5 and 15; it is free in government schools, which are open to all pupils with the right of residence in the Colony, including children whose parents are members of the armed services. The language of teaching is English but some Spanish is of necessity used in the infant stages as most children in Gibraltar know practically no English at the age of 5.

A Director of Education, selected by the Secretary of State, heads an advisory Board of Education. As most of the schools are religious in character the board is made up of representatives of the Protestant, Catholic and Hebrew communities, as well as of the armed services. The function of the board, which meets at least four times yearly, is to advise the Governor of the Colony on matters relating to educational policy. The administration of education is regulated by the Education Ordinance of 1950. The Director of Education is responsible for the control and supervision of the school system and inspects both public and private institutions. The greater part of the funds expended on education comes from colonial revenue, with a small proportion coming from private endowments for scholarships. Buildings of government schools are provided and maintained by the Public Works Department. The

school medical service sees that standards of hygiene are maintained, inspects the children, and provides for dental and ophthalmic treatment.

TYPES OF SECONDARY EDUCATION

The pupil who has completed the 7-year primary school and reached the age of 11+ continues at one of the three types of secondary school: grammar, modern or technical. Selection is based upon results of Moray House standardized tests. The written tests in English and arithmetic and the intelligence test are followed, in borderline cases, by an oral test conducted by a selection panel of which the Director of Education is chairman. Since 1959 a further test has been introduced at 13+, mainly for the purpose of correcting any errors in posting arising from the 11+ examination. To facilitate transfers at this stage the three types of secondary school follow a common curriculum for the first two years.

The curricula in secondary schools are similar to those for the corresponding types of school in the United Kingdom. The two grammar schools (boys and girls separately) have courses which aim at the General Certificate of Education (GCE) at Ordinary, Advanced and Scholarship levels, taken after 5 and 6 or 7 years of secondary study respectively. The Government offers an annual scholarship to a university or institute of higher education and there is also a private fund providing a similar bursary. The scholarships are awarded primarily on academic achievement. In addition the Government sends eight secondary school graduates each year to the United Kingdom for teacher training.

The technical school, for boys only, provides secondary education with a technical bias but also prepares pupils for the GCE. Woodwork, metalwork and general science are included in the curriculum. On completion of the technical school course a fair proportion of the boys enter public service as apprentices. A joint apprenticeship indenture has been accepted by the chief employers in the Colony: the dockyard, the city council, the army engineers and the Colonial Government. Entry to the apprenticeship scheme is by competition.

The secondary modern schools (two for girls and one for boys) provide an education with a practical bias, not usually beyond the compulsory school age, for children with no special aptitude for academic or technical studies. The girls spend one half-day per week in the cookery centre and another half-day in the home needlework centre.

For girls of 15, whether attending grammar or modern school, there is now provision for preliminary experience in nursing. While following their normal curriculum at school they attend the hospital for one half-day per week for lectures and visits to the departments and wards. Girls of 15 may also transfer to the commercial school which provides a full-time 2-year course in commercial and basic subjects.

Religious instruction forms part of the curriculum in all secondary schools. The evening classes provide instruction in commercial subjects, languages and art.

Out-of-class activities include organized team games such as football, hockey, cricket, etc. All secondary schools hold annual athletic meetings and some also arrange aquatic competitions. The schools have little space of their own for games but are permitted to use the playing grounds of the naval and military authorities and various sports associations. The Education Department does not conduct any youth activities directly but encourages those in existence such as the Boy Scouts, sea cadets, St. John's Ambulance cadets. On the cultural side the Department is helping the secondary schools to build up libraries; in particular it supplies periodicals which are used as source material for discussion groups on current topics and school debates.

A few teachers, including members of the religious orders responsible for conducting secondary grammar education, are recruited in the United Kingdom. The rest are locally recruited and are nearly all Gibraltarians.

TRENDS AND PROBLEMS

The introduction of compulsory education in 1951 and the high birth rate in Gibraltar have in recent years caused problems in accommodation of the secondary school population. These have been met, partly by taking over barracks vacated by the army. The anxiety of parents for grammar school places for their children is as great as elsewhere, but with separate grammar schools for boys and girls the number of pupils of grammar school quality is too low to ensure reasonable numbers in the sixth forms—particularly for the second year. For the same reason, work at Advanced level is difficult and expensive to organize. Secondary technical education is not popular (although there are signs of an awakening to the possibilities), with the result that the technical school tends to be filled by boys who have failed to gain admission to the grammar school rather than by boys who desire to follow a technical career. The launching of a continued apprenticeship scheme for all employers of technicians in the near future should go far to strengthen the call of technical education, and the need for work at Advanced level in the grammar schools will probably be met by organizing combined groups from the secondary schools, each of which will cater for one type of advanced work.

GIBRALTAR. DEPARTMENT OF EDUCATION. *Annual report.* Gibraltar, Government Printer.

STATISTICS

Population (mid-year 1958 estimate): 26,000.
Area: 2 square miles; 6 square kilometres.
Population density: 13,000 per square mile; 4,333 per square kilometre.

Summary of school statistics, 1953–57. Enrolment in primary and secondary schools in 1957/58 was 4,347 pupils representing about 17 per cent of total population. About 65 per cent of pupils were in primary schools. Girls made up over 50 per cent of enrolment in both primary and general secondary schools. There were 109 boys studying in the Technical and Dockyard School. The total number of teachers in all schools was 174, of whom two thirds were women; the average pupil-teacher ratio was 29 in primary and 20 in general secondary schools. Compared with 1953/54 enrolment in primary schools had increased by 7 per cent and in general secondary schools by 21 per cent. (See Table 2.)

Educational finance, 1957. Total public expenditure on education in the fiscal year beginning January 1957 amounted to 138,445 pounds sterling, or about £5.5 per inhabitant. This money was derived entirely from territorial revenue. Capital expenditure (£33,338) represented about 24 per cent of the total spent. The distribution of recurring expenditure by level and type of education is given in Table 1.

THE EDUCATIONAL SYSTEM

Education is compulsory for all children between the ages of 6 and 14 years. A certain number of boys and girls remain at school voluntarily until 16 or 17 years and over to follow a course of secondary education—grammar, technical or vocational.

All government schools in Malta and Gozo, whether primary, secondary or vocational, come directly under the central authority of the Director of Education and form part of the Education Department. The Director administers the Department through his two assistants, his inspectors and his administrative staff. Thus, heads of schools look to the office of the Director for their material requirements (provision of accommodation, furniture, books, the payment of teachers' salaries, etc.), and also for a lead in educational matters (the choice of books, the compilation of the syllabus, etc.), the general direction being carried out at Head Office in consultation with the schools and referred back to the teaching staff through the inspectors.

A comparatively small number of schools function in Malta outside the government system. The great majority of these private schools are run by religious orders at their own expense and on the modest fees charged to the pupils, although some are in receipt of an annual government subsidy which in no case at present exceeds £500. These schools vary in their general set-up; a certain number cater for pupils between the age of 5 and 18 and are single-sex schools except in the first years, others are almost entirely intended for young children of 3 to 6 years.

THE DEVELOPMENT OF SECONDARY EDUCATION

Up to now, the pattern of secondary education has developed without any rigid imposition by the government authorities. In so far as it caters for boys and girls over 14 years of age, it is outside the Compulsory Education Statute and the setting up of secondary schools has mainly depended on the initiative of the Government and of different bodies, especially religious orders.

The earliest foundations in this branch, as in the other forms of education in Malta, were made by the Church. The most flourishing boys' government-run grammar school today, known as the Lyceum, traces back its origin to a foundation made at the instance of the Bishop during the time of Grand Master Pinto as early as 1595, at which time it was established as a preparatory school for the university and known as a College of Education. The change to the name which it bears to this day was made at the time of the French occupation in the early 1800s.

Other well-known secondary schools began within the last hundred years as independent schools run by religious orders and have remained so.

In addition to these foundations are the seminaries, one in Malta and one in Gozo. Although the purpose of these schools is mostly to prepare young men for the priesthood, they give an education at secondary level which has been availed of by many parents whose sons have followed other walks of life.

An exception to this rule of initiative by a particular religious order is the school known as St. Edward College, which is run on the lines of an English Catholic public school.

On the government side, the growth of the Lyceum and the establishing of a branch of this school in Gozo was accompanied by the establishing in Valletta of a secondary school for girls.

In the 1920s, the Director of Primary Schools (as he was then styled), seeing the need to expand the field of recruitment for the teaching staff, set up the central schools. These were to a certain extent vocational since they catered expressly for boys and girls who intended to become teachers.

Although at first the level of attainment in these schools was not high, a tradition of good, firm scholarship was built up within this framework. Gradually, the top classes were led to a higher standard and, in the case of girls, a further central school known as the Higher Central School was set up in 1927/28 to prepare pupils for the Oxford School Certificate.

In time, the other four central schools (three for girls, including one in Gozo, and one for boys) also began to prepare students for the School Certificate examination, and during the war years the distinction between 'secondary' schools and 'central' schools was eliminated, leaving the Lyceum (Malta and Gozo) and four girls' grammar schools (including one in Gozo) to provide a secondary grammar education for boys and girls up to the age of 17 or 18. With this unification, the vocational aspect of the work of these schools was suppressed.

Administration

As indicated above, in Malta and Gozo the management of all matters concerning education (including secondary education) radiates from the central authority. There is a Board of Education which functions as an advisory committee; its members include persons outside the Education Department.

The Director of Education exercises his authority and carries out responsibilities through the office (clerical) staff, as far as the material requirements of the school are concerned, and through his staff of inspectors, heads of schools and teachers as regards the educational care of the thousands of children entrusted to him.

All personnel in the government schools are civil servants except for the few teachers who are engaged on special short term contract from the United Kingdom.

Working with and for the schools, though not permanently attached to the Civil Service, are the teaching staffs of the two training colleges. These have entered into special agreement with the Government of Malta to train teachers for the Department.

The training college for men teachers is in the hands of the Brothers of the Christian Schools (English Province) and that for women teachers is in the hands of the Society of the Sacred Heart. They are assisted in their work by lay staff from the United Kingdom and by local personnel (mainly inspectors) who are loaned by the Education Department on a part-time basis to help in the work of preparation of teachers and to act as liaison officers between the colleges and the Department.

In principle, teachers and heads of schools are liable to be posted or transferred to any school (according to whether the person concerned is in the primary or secondary section) to suit the exigencies of the service, but in point of fact the personal wishes of the teachers concerned are met in this matter wherever possible.

The interests of the teaching staffs are also represented by teachers' unions, of which there are three: the Malta Union of Teachers, the Lyceum and Secondary School Teachers Association (including teachers in technical schools) and the Head Teachers Association. These unions are consulted before decisions are taken which affect the conditions of service of the teaching staff.

Supervision and inspection. Because of the small numbers originally involved, the Director of Education has always taken a personal interest and share in the supervision of secondary schools. Within the last 12 months, the post of Inspector of Grammar Schools has been suppressed with a view to the unification of the inspectorate.

Finance. The Education Department like other government services is financed from local revenue and grants from the United Kingdom.

Within the last 10 years, the financial provision has been increased from £551,105 in 1950/51 to £1,412,867 in 1959/60. A considerable number of fine new buildings for schools have been set up with the aid of monies from the Colonial Development and Welfare Fund. Among these new schools and in the secondary sphere are the new Lyceum, catering at present for 1,500 boys, the new Girls' Grammar School at Blata l-Bajda, still under construction but intended ultimately to house 42 classes, the Secondary Technical School for Boys and the parallel one for girls, each to cater for 1,000 pupils, and a boys' school in Gozo providing both secondary technical and secondary grammar courses.

The distribution of funds, including the payment of teachers, is carried out by the central authority according to a schedule presented to the Government and approved in the estimates. All expenditure is thus undertaken and controlled by the Education Department although the wishes of the heads of schools are consulted and suited as far as possible when it comes to equipment and teaching materials.

The government schools, both primary and secondary, are free.

School welfare services. These now cover the complete remission of fees, the provision of free books and also the improved care of the health of schoolchildren. All children attending government schools, both primary and secondary, are given a daily allocation of free milk.

TYPES OF SECONDARY EDUCATION

In Malta and Gozo, some 12 per cent of the boys and girls from the primary schools at present receive secondary education. It is planned that this percentage should be raised to 25 per cent, the provision being equally distributed between the secondary grammar and the secondary technical sections.

Since admission to the secondary schools is by an examination in English and arithmetic, designed also to test the intelligence of the candidates, any expansion largely depends on an increased number of children from the primary schools being able to reach the required standard. But there is no doubt that the improvements being implemented in the primary sphere of education are bearing fruit, and in the future there will be no lack of boys and girls who will go forward to secondary schooling.

There is no minimum age-limit for entry into the secondary schools, but no boy or girl who will be 14 or over by 1 October of the year in which he seeks admission can be considered.

The Lyceum (with its branch in Gozo) and the four girls' grammar schools (including one in Gozo) offer a course of studies normally lasting five years and leading to the General Certificate of Education examination.

The Secondary Technical School for Boys (also with a branch in Gozo) and the recently established parallel school for girls aim at the same ultimate goal with the difference that more emphasis is here laid on the practical subjects—woodwork and metalwork in the case of boys, and domestic science, art and crafts in the case of girls. The purpose of these practical subjects is however intended to be of an educational and not of a vocational nature.

In addition to these secondary schools, there are various technical centres in which vocational training is given to boys, usually between the ages of 14 and 17/18 years. These are the Technical Schools at Hamrun and Mriehel (numbers being 261 and 173 respectively) which prepare for careers in mechanical and electrical engineering as well as in woodwork, the Tailoring School with 92 pupils, and the Nautical School with 63 pupils.

Admission to these schools is also by examination held separately from that for admission into other types of secondary school.

Children who do not enter one or other type of secondary school complete their education in the all-age primary schools, where they remain until they turn 14. So far no alternative form of secondary education on the lines of the English secondary modern school is available for them though the education authorities are fully alive to the particular needs of these boys and girls and are actively considering how best to equip them for after-school life.

On leaving secondary grammar school, students normally proceed to the Royal University of Malta, to the training colleges, or enter employment.

The school year. Secondary schools open on 1 October and close on 15 July. There are three terms: the autumn term from 1 October to 23 December, the winter term from 7 January to the Wednesday in Holy Week, and the spring term from the Wednesday following Easter Sunday to 15 July.

Owing to the heat, classes are held in the morning only from 1 June to 15 July. Christmas holidays consist of 14 days, and the Easter holidays of 7 days. Summer holidays are from 16 July to 1 October.

The school week is from Monday to Friday inclusive with seven daily periods of 45 minutes each. There are four such periods in the morning and three in the afternoon.

General secondary schools

These include the secondary grammar and the secondary technical schools. Both have a 5-year course to prepare candidates for the General Certificate of Education though with a bias in each case on different aspects of the curriculum, the one on the academic and the other on the practical subjects and science. In Gozo, the one school contains both branches—the nearest approach to a bilateral school in these islands.

The aim of these schools is to give a good general education to pupils who will go on to higher studies at the university, the training colleges and, when it has been established, the Polytechnic. Many of these students will therefore later become priests, lawyers, doctors, teachers, industrialists and high ranking civil servants—men and women who will occupy key posts in the social structure of the future. Others will leave school to find employment in banks, in lower grades of the civil service, in industry and in other posts and will thus also exercise an influence on the affairs of the Maltese people.

Yet, underlying all material objectives in these schools is the resolute purpose of giving all pupils a good character formation in keeping with the religious traditions which have been the heritage of the Maltese people since early Christian times.

Recruitment of pupils, etc. Entrance examinations are held in June/July in the case of the secondary grammar and the secondary technical schools. The two types of secondary school have each a separate examination so that a great number of pupils sit for both and, should they be successful, choose then the type of school they wish to attend. There is nothing to prevent their doing this provided that they have not reached the age of 14 on 1 October of that particular year. There is no lower age limit and a pupil may sit for the examination several times over.

Curriculum. The compulsory subjects are religion, Maltese, English, two languages (out of Latin, Italian and French), arithmetic, algebra, geometry, history and physical education.

In addition, the pupils have to choose one of the following groups of subjects: (a) physics and chemistry (with biology instead of history added in form 4); (b) general science and geography; (c) geography and art; (d) needlework and housecraft (for girls).

Modern languages are taught as far as possible by the direct method and other subjects are taught through English.

Students are promoted from one form to a higher form through an annual examination held at the beginning of July, but those who fail may sit for a supplementary examination in September. The papers for these examinations are set and marked by two examiners under the direction of a moderator, these persons being responsible for a particular subject in one or more forms of any of the girls' grammar schools or the Lyceum.

Although the normal school leaving certificate to which the 5-year course of studies in the school is directed is the Oxford General Certificate of Education, a small number of students remain on at school in the sixth form after that examination in order to take one or more subjects at Advanced level.

The setting up of the sixth form from which these examinations are taken at the end of a 2-year course is a recent development. The purpose is to enable pupils to obtain direct entry to courses leading to first degree examinations in all English universities as well as to attain that standard of scholarship which sets a hallmark on a completed course of secondary school work.

The pattern of the sixth form is the same as that followed in the grammar schools in England. Students attending independent (private) schools may, if they have been successful in the GCE examination at Ordinary level, enter the sixth form in the government schools.

The teaching of practical subjects (woodwork, housecraft, needlework, metalwork) in general secondary schools is undertaken for its educational value and not as vocational training.

Teaching staff. Selection is made by an interviewing board specially constituted by the Government for the occasion.

Where possible, it is expected that the person appointed should be a university graduate. Many teachers, however, are men or women who have undertaken a 2-year training college course, have gained teaching experience in the primary schools and possess further suitable academic qualifications.

In order to help non-graduate members of staff to improve their qualifications, scholarships are provided for a small number of teachers to undergo graduate courses in United Kingdom universities.

A few specialist teachers, mainly for English, are recruited on a short-term agreement from the United Kingdom.

To make up for temporary vacancies, visiting masters and mistresses are engaged as required; they are paid by the hour and receive no appointment, the arrangement being liable to be terminated at short notice by either party.

Vocational and technical schools

Vocational and technical schools cater for an older entry (14 to 16) and are intended as a direct preparation for the craftsman's work. However, in these schools, too, some subjects are taught for their value from the point of view of right living and general education. These subjects are religion, English, mathematics and Maltese.

At present, technical and industrial training is carried on at the following centres.

Technical School, Hamrun. The school offers both a day and an evening course, the ages of the day students ranging between 14 and 17 years. Three-year full-time courses are given in the theory and practice of (a) electrical engineering, (b) mechanical/marine engineering and (c) technician qualifications (City and Guilds of London Institute). All courses lead to the City and Guilds Intermediate Certificate, to the General Certificate of Education examination, and to most public competitive examinations in the engineering field. The subjects taught are religion, Maltese, English, mathematics, applied heat and heat engines, electricity and mechanism, mechanics, engineering drawing, practical geometry, metalwork and engineering technology. Laboratory work is carried out in most of the engineering subjects. On completion of their 3-year course these students continue their practical training in the school workshops, government departments and at the Naval Dockyard.

Technical School, Mriehel. The aim of this school is to provide 3-year full-time courses for automobile engineering and cabinet-making, leading to the City and Guilds Institute examinations. The courses cater for boys between the ages of 14 and 17 and provide an alternative training for those who do not secure a place in any of the apprenticeship schemes available.

During the first six months all students follow a basic course in English, Maltese, religion, mathematics, science, drawing, and, in addition, needlework and woodwork.

Government Tailoring School, Valetta. The course is of 3 years' duration and the pupils are trained to reach a standard to enable them to sit for the Intermediate Grade of the City and Guilds Institute examinations.

Government Nautical and Wireless Telegraphy School. The scope of this school is to train Maltese boys for officer careers in navigation, wireless telegraphy and telecommunications and also for careers in other allied trades and professions. General subjects are included in the curriculum.

Boys of 14 years of age and over who possess the required standard of education are eligible to follow these courses.

Government Apprentices' School. All apprentices are released by their respective firms to attend classes at the school and to follow a course of studies. They receive full pay during the time spent in this way.

Students are trained in the new techniques which are being introduced in industry. As far as possible, courses are arranged to run parallel with the practical experience being gained by the student at his work. Any apprentice who works conscientiously is thus enabled to qualify for a better post in industry.

In addition to the technical side, students also attend regular classes in English and mathematics.

The trades catered for are mechanical and electrical engineering, woodwork, tailoring, boot and shoe manufacture, printing, counter-service and waiting, goldsmith's and silversmith's work, plumbing and agriculture.

Evening classes. In the technical centres described above, in primary schools in different parts of Malta and Gozo, at the Lyceum and at the secondary technical school, Paula, evening courses in both academic and technical subjects are held throughout the scholastic year. All can be admitted to these classes provided that there are vacancies and that they have attained a certain minimum age.

School of Art. At this school, which is run by the Education Department, evening classes in drawing, painting, decorative art, modelling, carving and history of art are held.

Commercial courses. The Education Department does not at present provide for a full commercial course in any of its schools.

However, during the midday break at the Lyceum, classes are provided on a voluntary basis for boys in form 5 who wish to take up shorthand, book-keeping and/or typewriting.

Evening classes in the subjects are also provided. Registration for these classes is usually very heavy, as they are popular with those who intend to seek employment as clerks in private firms or with the Government.

A number of commercial classes run by private individuals are also available on payment of fees.

In the newly established Secondary Technical School for Girls, it is intended to set up a complete commercial course as one of the alternatives to be chosen by girls after they have completed the basic course which will extend over the first three years.

Domestic science and careers for girls. The teaching of domestic science forms part of the curriculum of the upper classes in the all-age primary schools and the subject can also be taken in grammar schools.

However, the teaching of this subject in these schools is carried out with the aim of enhancing the general education of the young women and, in grammar schools, of securing a pass in the GCE examination.

It is only with the setting up of the Secondary Technical School for Girls already mentioned that it will be possible to provide a full vocational training in housecraft.

Teacher training schools

Reference has been made to the two teacher training colleges. The colleges offer a 2-year residential course, and examinations are conducted in collaboration with the London University Institute of Education. Every year this institute nominates two examiners who come out to Malta to help in assessing the marks of the students' practical teaching and to whom, later, sample papers from the students' final written examination are referred.

Out-of-school activities

The Lyceum, the Secondary Technical School for Boys and the technical centres show a keen interest in sports and especially in football. The Secondary Schools Sports Association organizes cross-country races and other sporting events. The Lyceum has a school orchestra and runs its own Boy Scout troop.

The girls' grammar schools are handicapped by lack of playgrounds and recreational facilities.

TRENDS AND PROBLEMS

Education in Malta is both old and new. In so far as it depends on traditions of the Catholic way of living and of family life, it is old; but the practice of schooling is comparatively new, at least as far as the community as a whole is concerned.

It is salutary perhaps to remember that compulsory education has been in force in Malta for only 16 years. The education authorities are faced with many problems including lack of facilities, which it is difficult for Malta's budget to provide, lack of trained personnel, and certain prejudices in the outlook of the general public.

Malta has also its language difficulties to meet, since its own native tongue is not sufficient to carry it into the outside world nor to take it far in cultural and scientific pursuits. In this, Malta, like other countries so placed, faces the difficulties of bilingualism, the two languages being English and Maltese.

Although the Maltese on the whole are naturally gifted in language learning, it is bound to add to the burden of study to have to carry on one's work in a second language, at least until such time as one is completely at home in both. Fortunately, this standard is reached in a surprisingly large number of cases.

The trends in secondary education are towards the provision of more facilities and to the raising of standards. Plans are in hand to take more pupils into the grammar and the secondary technical schools; ways of giving the best preparation to boys and girls who go out into the world on completion of the primary school course are constantly being reviewed. The raising of standards is the daily preoccupation of those responsible for education in these islands. The objectives may be simple, yet time and effort are required in order to reach them.

But education in Malta, both primary and secondary, has a great fund on which to draw: it has the backing of parents who want to see their children enjoying opportunities that never came their own way.

STATISTICS

Population (mid-year 1958 estimate): 322,000.
Area: 122 square miles; 316 square kilometres.
Population density: 2,639 per square mile; 1,019 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 there were over 75,500 pupils enrolled in schools at all levels, representing about 24 per cent of the total population of the islands. There were, in addition, some 7,600 adults attending vocational evening classes. Over 85 per cent of total enrolment was in primary schools, where the proportion of girls was nearly 50 per cent. In general secondary schools girls formed 44 per cent of enrolment and in teacher training colleges 74 per cent. The teaching staff in primary and general secondary schools numbered nearly 3,000 in 1957/58, an increase of 38 per cent compared with 1953/54. Nearly two thirds of teachers are women. The pupil-teacher ratio in primary schools was about 23 in 1957/58. Compared with 1953/54 there was an increase of 16 per cent in primary enrolment, 33 per cent in general secondary enrolment and 33 per cent in teacher training colleges. (See Table 2.)

Educational finance, 1956/57. In the fiscal year beginning September 1956 total public expenditure on education amounted to 1,851,678 pounds sterling, or about £4.7 per inhabitant. This money was provided by the Central Government from territorial revenue and a grant from the Colonial Development and Welfare Fund. Capital expenditure (£792,094) amounted to 43 per cent of the total spent. The distribution of recurring expenditure by level and type of education is given in Table 1.

BRITISH SOLOMON ISLANDS PROTECTORATE

The Solomon Islands form one of the territories which come under the jurisdiction of the British Western Pacific High Commission. They are administered directly by the High Commissioner, whose headquarters are at Honiara. For educational matters in the Solomons he is assisted by an advisory committee established under the Education Regulation enacted in 1954.

The provision of education is largely in the hands of five missionary societies although a number of schools have been opened in recent years by the Government and by native councils (local authorities). The Education Regulation provides for the registration of non-government schools and teachers, the inspection of schools and the payment of government subsidies to schools reaching a certain standard. General control and supervision of the whole system are the responsibility of the Chief Education Officer, who is head of the Education Department.

The complete primary course lasts 7 years and is divided into junior (standards 1–4) and senior (standards 5–7). Owing to the multiplicity of local languages, English is introduced into the curriculum at an early stage and quickly becomes the medium of instruction. The full course leads to the Senior Certificate examination.

The secondary course lasts 5 years. At present the only institution providing general education at this level is the King George VI school at Auki, a government boarding school for boys, which comprises a senior (i.e. upper primary) and a secondary department. The school was opened in 1950 as a senior school but is now being developed as a single-stream secondary school. The secondary classes are now in their third year, and, in due course, the pupils will sit for the School Certificate examination.

Extra-curricular activities include stamp clubs, first-aid training, personal gardens, handicrafts, sing-songs, sports and games.

Both the Government and the missions provide scholarships and facilities for general secondary education overseas and a few students have gone on to post-secondary teacher training or higher education.

The teacher training section at the newly-opened British Solomons Training College has an annual intake of 20 trainees. Entrants are required to have the Senior Certificate, i.e., to have completed senior school. Some missions provide limited teacher training locally or overseas and the Government also provides scholarships for attendance at colleges outside the Protectorate.

Vocational training at the British Solomons Training College began with a 2-year course in carpentry and joinery. Courses available at various mission schools include carpentry, boat-building and printing.

TRENDS AND PROBLEMS

Two mission schools already have secondary classes but it is unlikely that they will be able to develop beyond first- or second-year secondary teaching for some time to come. A third mission has planned to start developing its senior school into a secondary school within about three years. One mission regularly sends its senior school pupils to Rabaul, in the Territory of Papua and New Guinea, for secondary education and training as pastor/teachers. The opening of a government secondary school for girls is contemplated but this project will be subject to the recommendations of a Woman Education Officer joining the Department in November 1959. Short training courses are held at the Marine Base, Tulagi, but courses of 12 months are planned to provide instruction in seamanship and in the care and maintenance of diesel engines.

[*Text revised by the Senior Education Officer, Honiara, in September 1959.*]

BIBLIOGRAPHY

BRITISH SOLOMON ISLANDS PROTECTORATE. *Report on education.* [Honiara, Guadalcanal.] Annual.

STATISTICS

Population (mid-year 1958 estimate): 105,000.
Area: 11,500 square miles; 29,785 square kilometres.
Population density: 9 per square mile: 4 per square kilometre.

Summary of school statistics, 1955–57. In 1957 total enrolment was about 14,350 pupils in 453 primary schools and 1 secondary school, representing approximately 14 per cent of the total estimated population. The proportion of girls to total primary enrolment was 37 per cent; there were no girls enrolled in the only public secondary school in the islands. There were 390 teachers of whom 103, or 26 per cent, were women; the pupil-teacher ratio was 36 in primary schools and 25 in the secondary school. (See Table 1.)

Educational finance, 1957. In 1957 total expenditure on education amounted to 116,393 Australian pounds or approximately £1.1s. per inhabitant. Of the total, 19 per cent was derived from territorial resources, 20 per cent from United Kingdom funds, 2.5 per cent was contributed by local authorities and the remaining 59 per cent came principally from missions. Capital expenditure amounted to 26 per cent of the total spent. (See Table 2.)

THE EDUCATIONAL SYSTEM

The legal basis of Fiji's educational system is the Education Ordinance of 1929 by which the Education Department was constituted and the post of Director of Education established. Regulations governing the conduct of existing government schools were gazetted and provision was made for a system of grants-in-aid to primary schools and for the training, certification and classification of teachers. Regulations were issued governing the attendance of pupils at various types of schools and laying down syllabuses of instruction. This ordinance is now out of date, however, and has become increasingly difficult to implement. A new ordinance is in preparation and, it is hoped, will come into force in 1960.

In 1956, the control of education passed from the Board of Education to the Director of Education, acting on the advice of a multi-racial Advisory Council of 14 members.

The Education Department trains, appoints and transfers government teachers, inspects all schools, and is particularly concerned with the content and standard of primary, post-primary and technical education throughout the Colony.

Because of the multi-racial nature of the population (approximately 49.1 per cent Indian, 42.4 per cent Fijian, 4.5 per cent European, 1.2 per cent Chinese and 2.8 per cent 'others'), and because there is no lingua franca, separate schools are provided at the lower levels for each race, so that during their early years at school children can be taught in their mother tongue. There are, however, a number of primary schools for mixed races in urban areas where the pupils already enter school with some knowledge, albeit imperfect, of English and can thus profit from instruction in that tongue.

In non-European primary schools the medium of instruction for the first 4 years is the vernacular, English being taught as an additional language. For the second 4 years, English is the medium of instruction, vernaculars continuing to be taught as separate languages. Where the progress of the pupils and the ability of the staff warrant it, the changeover is put forward by one or more years.

At the secondary level, where the language problem does not arise, most of the schools are multi-racial.

Of the 521 primary and 38 secondary schools in the Colony, 34 are wholly maintained by the Government, 87 are managed by various missions, and the remaining 400 are run by various private bodies (mainly local committees).

The growth of educational facilities since the second world war is shown in the table opposite.

In Fiji the full primary course lasts 8 years. At the end of class 5 Fijian pupils may sit for the entrance examination to the intermediate schools (classes 6 to 8) which are for Fijians only. The Secondary Schools Entrance examination is taken at class 8. Secondary schools are open to all races.

EXPANSION OF EDUCATION BETWEEN 1946 AND 1959

THE DEVELOPMENT OF SECONDARY EDUCATION

Owing to the rapid increase in population, especially of Indians, most of the funds available for education have in the past been directed to the provision of primary education, leaving little to spare for secondary schools. Since 1946, however, there has been a growing demand for secondary education and the extent to which this demand has been met can be judged from the figures for secondary education in the above table.

The legal basis of secondary education is covered by the general provisions mentioned in the previous section of this report.

Administration. The control of secondary education is vested in the Director, who has full control over government secondary schools and is represented on the board of governors of aided non-government secondary schools (over which he can exercise considerable control by means of the grant-in-aid system). Unaided secondary schools are usually controlled by elected committees or by the heads of the missions concerned, and the Director's control over them is largely nominal.

The Inspector of Secondary Schools reports to the Director on the efficiency of all secondary schools (government-aided and non-aided) and assists and advises principals and staff on all matters pertaining to the efficient functioning of their schools.

New Zealand teachers in government secondary schools recruited on contract under the Scheme of Co-operation with New Zealand are inspected annually by a New Zealand inspector who visits Fiji for the purpose.

There has been a welcome growth in recent years of parent-teacher associations at almost all secondary schools.

Finance. The full cost of government secondary schools is borne in the first instance by the Central Government.

Tuition fees are levied at a rate calculated to cover 25 per cent of actual tuition costs, while boarding fees are fixed at such a rate as to recover the full cost of boarding.

Aided non-government secondary schools are eligible to receive from Central Government funds a capital grant of up to 50 per cent of the cost of approved building projects, and recurrent grants covering half the cost of the approved salary bill together with a substantial grant (mainly on a *per capita* basis) towards other approved recurrent expenses. The managements charge fees to cover remaining expenses.

Unaided secondary schools receive no direct financial aid from the Government but enjoy the benefit of many departmental services.

In government schools parents with inadequate means may be granted full or part remission of fees at the taxpayers' expense, and a limited number of scholarships, awarded on merit, are also available. Remission of fees in non-government schools is a matter for the managements concerned.

Buildings and equipment. There are two main categories of secondary schools: (a) recognized schools, which must fulfil the minimum requirements of the Medical Department in respect of space, lighting, ventilation and sanitation; (b) registered schools which not only fulfil the minimum requirements but which, in addition, have such necessary adjuncts as science laboratories and/or handicraft or homecraft facilities.

Only selected registered schools may receive recurrent grants-in-aid but in several instances capital grants have been awarded to schools to enable them to raise the standard of their buildings to a level where they are eligible for grant aid.

School welfare services. Schools are regularly visited by medical officers and by the Mobile Dental Clinic both of which are under the control of the Director of Medical Services, with whom close liaison is maintained in the matter of schoolchildren's health.

Auxiliary services. (a) *Visual aids:* selections of filmstrips and films are regularly received from the New Zealand National Film Library and are circulated to all secondary schools equipped with projectors. (b) *Book-room:* the Education Department maintains a book-room from which all schools may purchase their requirements of stationery, textbooks, etc.; in the case of country schools, the purchases are despatched by post. (c) *Schools broadcasts:* from 2.15 to 2.45 on three afternoons a week, broadcast lessons are given to secondary schools, using material supplied mainly by the British Broadcasting Corporation; in addition, particularly for lessons on literature, some use is made of local talent. (d) *Book-boxes:* many secondary schools still in the process of building up libraries, avail themselves of the service maintained by the British Council, which circulates boxes of selected books on loan.

TYPES OF SECONDARY EDUCATION

The secondary schools of Fiji are mainly of the academic type and lead either to the Cambridge Oversea or the New Zealand School Certificate. The Fiji Junior Certificate examination is taken at the end of the second year of the secondary school course (form 4), and the possession of this certificate in general is the minimum qualification for promotion to form 5 and for admission to the Training College and the government clerical service. Candidates must pass in English and arithmetic and in four to six other subjects out of a choice of over thirty. It is shortly intended to reduce both the choice of subjects and the number in which a candidate must pass. The School Certificate examination (New Zealand or Cambridge) is taken in form 5 and the New Zealand University Entrance examination in form 6.

The past three years have seen the introduction of 4-year post-primary courses in agriculture and building trades at the Ratu Kadavulevu School (a government boarding school for Fijians) and of a 4-year secondary modern course at the Labasa Secondary School (a government day-school with a predominantly Indian enrolment). In addition, new or increased facilities for homecraft and handicraft teaching have been provided at a number of other schools. With reference to the trades, it is hoped that 1960 will see the establishment of an Apprenticeship Council and the setting up of a proper system of indentured apprenticeship; as concerns agriculture, consideration is being given to the provision of some sort of student-farmer scheme which will, it is hoped, lead into a land settlement scheme.

A secondary school leaver may attend evening extension classes at one of three centres—Labasa, Suva or Lautoka—where he may either advance his academic subjects, or acquire some skills at woodwork, metalwork, shorthand and typing, etc.

Students who pass the New Zealand University Entrance examination may apply for admission to a New Zealand or Australian university, but if they want to do so on a government scholarship they must first spend a year in the upper sixth form.

The school year normally starts on the second Tuesday in February and is divided into three terms, each of approximately 13 weeks. The school year normally ends on the second Friday in December and is followed by the Christmas vacation of eight weeks. On five days a week, Monday to Friday, the school day starts at about 8.45 a.m. and finishes at 3.30 p.m., with recesses for 15 minutes in the morning and for one hour at lunch time. Each day's work is divided into seven periods of about 40–45 minutes each.

General secondary schools

With few exceptions the secondary schools of Fiji are not designed to prepare pupils directly for a particular career. A general education is given so that the boys and girls may become good, useful, cultured citizens possessing the basic knowledge to proceed into a variety of occupations, whether they be professional, artisan or commercial.

Recruitment and selection of pupils is through the Secondary Schools Entrance examination, candidates being required to list the schools of their choice, in order of preference, at the time of entering for the examination. For admission to a government school a child must be

under 15 years of age, while for a grant-aided school he must be under 16.

The subjects taught include English language, arithmetic, general science, chemistry, physics, biology, health science, English literature, history, geography, French, Latin, Fijian, Hindustani, mathematics, shorthand, typewriting, book-keeping, commercial practice, arts and craft, woodwork, metalwork, technical drawing, needlework, homecraft and cooking.

The following is a fairly typical time-table (number of periods per week shown in parentheses): English (5), arithmetic (4), history (4), geography (4), mathematics (4), Fijian or Hindi (3), science (4), literature (3), singing (1), physical education (1), arts and crafts (2); but where appropriate facilities are available, some of these subjects are replaced by needlework, homecraft, cooking, technical drawing, etc.

The lowest secondary class is called form 3. Promotion is almost automatic from the third to the fourth form. Promotion to the fifth form depends on a pass in the Fiji Junior Certificate examination. Promotion is again fairly automatic from the lower fifth to the upper fifth form, but no pupil is admitted to the lower sixth form unless he has either passed the New Zealand School Certificate examination or has obtained a good pass in the Cambridge Overseas School Certificate examination. Promotion to the upper sixth is limited to those who have passed the New Zealand University Entrance examination.

Many teachers in government secondary schools are recruited from abroad, mainly from New Zealand under the Scheme of Co-operation with that Dominion. In the Methodist and Catholic mission secondary schools teachers from abroad are recruited mainly from Australia and New Zealand. Indian Committee schools, both aided and unaided, recruit their staffs partly from India but mainly locally. An increasing number of posts in all secondary schools, however, is now being filled by local teachers who have received their secondary education in Fiji and have proceeded to New Zealand or Australia for their university degrees.

Vocational and technical schools

For the most part vocational and technical training is given informally in the course of normal employment. Schemes of apprenticeship (mainly unindentured) are operated by the Public Works Department and the Colonial Sugar Refining Company, but in these schemes also training is given mainly in the course of the normal production work. Full-time courses in agriculture, building and stenography are available for a limited number of students, and part-time classes in academic, vocational and technical subjects are available through the extension class programme of the Education Department.

Agriculture. There are four main institutions for the teaching of agriculture—the Koronivia Farm Institute, Navuso Agricultural School, the agriculture course at Ratu Kadavulevu School and Drasa Training Farm.

Of these, the highest level training is given at the Koronivia Farm Institute which is run by the Department of Agriculture to provide recruits for its own field staff, for other Government Departments and for the farming industry in general. Ten boys, preferably of School Certificate level, are selected annually to attend a 2-year course. The theory of crop and animal husbandry and related subjects is taught and practical work is carried out on the institute's farm.

The 4-year courses at Navuso Agricultural School and Ratu Kadavulevu School have similar aims but whereas the former recruits boys aged at least 15 from primary classes 6–8, the latter recruits 14-year-olds at class 8 level. Both schools have large farms (600 acres and 840 acres respectively) on which the practical work of the courses is carried out. The Navuso course is mainly practical, only one day a week being devoted to classroom subjects, whereas pupils at Ratu Kadavulevu School spend only a third of the normal school hours in the field. Student-farmer schemes are at present under consideration in which ex-pupils of these schools will gain experience, under guidance, of small farming on an economic basis.

The Drasa Training Farm managed by the Colonial Sugar Refining Company is spread over 350 acres; it specializes in the training of Fijians who own land in the sugar-cane growing area in all aspects of cane cultivation, including the management and care of farm animals and the production of food crops. A government teacher is seconded to the school for academic teaching. Twenty-seven boys are admitted annually for a 3-year course. Their ages range between 16 and 18 and their standard of attainment between class 5 and class 8. Lectures on all aspects of cane growing are given for four hours per week for the first four months of each year and approximately 30 hours per week are devoted to practical work.

Mechanical, civil and electrical engineering. The Public Works Department has training schemes for (a) professional civil engineers, (b) road construction supervisors, and (c) tradesmen; all of these are based upon 'on-the-job' training, the apprentice being given fixed periods of work in the various sections of the Department which relate to his studies. Apprentices under the professional civil engineers scheme are recruited at University Entrance level with credits in mathematics, physics and allied sciences under which they gain exemption from the Common Preliminary examination of the Joint Engineering Board. They undertake a 5-year course during which they study by correspondence for the examination for Associate Membership of the Institute of Civil Engineers. Up to the present none of these apprentices has completed this course. Apprentices under the road construction supervisors scheme are recruited at Fiji Junior Certificate level and are given a 3-year practical course. Trades apprentices serve a 5-year unindentured apprenticeship during which they receive guidance from the appropriate trade supervisor.

The Colonial Sugar Refining Company operates a training scheme in mechanical and electrical trades at each of its five sugar mills in the Colony. Boys are recruited at primary school leaving level, 15 to 20 being recruited annually for a 5-year course. They study the appropriate trades course of the Brisbane Technical Correspondence School on three afternoons per week, are assigned homework, and receive practical training on the job for approximately 40 hours per week.

No full-time courses are available through the Education Department, but part-time theory courses for garage mechanics are held in the larger centres. Recruitment for the electrical courses is mainly confined to mature students who, having had several years in the electrical installation trade, wish to qualify for the local Wireman's Certificate.

Building trades. Full-time courses are available at Ratu Kadavulevu School, Lelean Memorial School and Fulton Missionary College. The Ratu Kadavulevu School course (which is a parallel to the agricultural course described above) is the most comprehensive; recruitment is from class 8, the Fiji Junior Certificate in building subjects is taken in the second year and the course continues a further two years. Practical work at present is concentrated on a large scale school rebuilding project for which a sum of £12,000 per year is available for the purchase of materials. Since the self-building programme began in 1957, trades course pupils have constructed some 28,000 square feet of buildings at a cost of £42,000. Theory lessons and general subjects are taught throughout the course. Boys leaving this course enter industry as third year apprentices.

The Lelean Memorial School and Fulton Missionary College at present recruit pupils of a lower standard for a course lasting 3 years. Practical work is limited mainly to workshop projects and to the maintenance of buildings, although new work on staff housing and the building of dormitories is occasionally undertaken.

There are post-primary rural crafts courses, with an emphasis on building subjects, which are intended to assist the villager to lead a fuller life, and part-time classes in carpentry are available at 10 centres.

Commercial and distributive occupations. A full-time course lasting one year is held at the Government Stenographers School. Ten to 15 girls who have passed the School Certificate examination are recruited annually, the majority of whom find employment in government service. In addition to the vocational subjects, English is taught and speech training is given.

Part-time classes are held at a private school in Suva and at three extension class centres, whilst a number of secondary girls' schools provide courses emphasizing commercial subjects.

Teacher training schools

There is no teacher training at secondary level in Fiji. Potential secondary school teachers obtain appropriate degrees at overseas universities (either on scholarship or privately) and usually undertake a one-year post-graduate teacher training course before returning to Fiji.

Out-of-class activities

There is a flourishing Secondary Schools Sports Association which holds an annual sports and athletics competition in which nearly all secondary schools participate. The Boy Scout and Girl Guide movements are both rapidly gaining ground in the secondary school system.

TRENDS AND PROBLEMS

During the period 1956–60 the main emphasis has been on the development of secondary education in order to provide a better balanced educational system. This is being achieved not so much by the construction of new government secondary schools as by the award of substantial capital and recurrent grants to the managements of existing (and occasionally new) non-government secondary schools to enable them to provide better and more appropriate facilities.

As a result of this policy, by the beginning of 1960 there will be approximately 1,180 form 6 places available in government and aided secondary schools. The number of children completing the primary course in 1959 was approximately 4,895, of whom only 667 achieved 50 per cent or more of the total marks in the Secondary Schools Entrance examination. It is therefore evident that the number of form 3 places in such schools is likely to be more than adequate for several years to come, and the Education Advisory Council has accordingly recommended (and the Government has agreed): (a) that in future non-government secondary schools should be added to the grant-aided list only as and when the number of passes in the secondary schools entrance examination warrants such action; and (b) that when offering grant-in-aid to such additional schools, preference should be given to those which provide or are prepared to provide non-academic courses.

STATISTICS

Population (mid-year 1958 estimate): 368,000.
Area: 7,055 square miles; 18,272 square kilometres.
Population density: 52 per square mile; 20 per square kilometre.

Summary of school statistics, 1953–57. In 1957 total enrolment in primary and secondary schools was 69,300, representing about 20 per cent of total population. There were in addition over 500 people attending adult extension courses. Of the total enrolment about 95 per cent was in primary schools, 5 per cent in secondary schools (general and vocational) and 0.3 per cent in the teacher training

college. About 45 per cent of primary school pupils were enrolled in Fijian schools, 43 per cent in Indian schools, 4 per cent in European schools, 7 per cent in mixed schools and 0.3 per cent in Chinese schools. At the general secondary level, however, over 50 per cent of pupils enrolled were in Indian schools and only 14 per cent in Fijian schools, 26 per cent in mixed schools and the remaining 10 per cent in European schools. At the primary level, the proportion of girls enrolled in Fijian schools was 47 per cent and in secondary Fijian schools 36 per cent. In Indian primary schools 43 per cent of pupils were girls but in Indian secondary schools only 28 per cent. The average percentage of girls enrolled at all primary and secondary schools was about 44 per cent in 1957. The teacher training school caters for all races and girls formed 41 per cent of enrolment in 1957.

Enrolment in primary schools increased by 20 per cent between 1953 and 1957 and in general secondary schools by 29 per cent over the same period. The number of students in the teacher training college did not increase during the period under review. In 1957 the schools were staffed by over 2,050 teachers including about 35 per cent women. The average pupil-teacher ratio in primary schools was 35 and in general secondary schools 23. (See Table 3.)

Examination results in secondary education, 1953–57. Table 2 gives available details of candidates passing secondary school examinations. The Fiji Junior Certificate examination was passed by 427 pupils in 1957 compared with 311 in 1955, an increase of 37 per cent. The numbers sitting the Cambridge Oversea School Certificate reached a peak of 155 in 1956 and declined to 118 in 1957. No information is available on numbers of female candidates. The teacher training final examination is passed by between 80 and 90 students each year.

Educational finance, 1957. Total expenditure by the Education Department in the fiscal year beginning January 1957 amounted to 880,971 Fijian pounds, of which nearly all (£875,051) came from territorial revenue and the remainder from the Colonial Development and Welfare Fund. There was in addition considerable expenditure by the local authorities and voluntary agencies, including an estimated amount of £180,000 spent by missions. Capital expenditure represented about 12 per cent of the total spent by the Education Department. The distribution of recurring expenditure by level and type of education is given in Table 1.

1. In addition, there are handicraft and domestic science centres attended by primary and secondary pupils.

GILBERT AND ELLICE ISLANDS

The Gilbert and Ellice Islands Colony, which includes Ocean, Christmas, Fanning and Washington Islands besides the Gilbert, Ellice and Phoenix groups, is administered by a Resident Commissioner responsible to the High Commissioner, Western Pacific, whose headquarters are at Honiara, British Solomon Islands Protectorate.

THE EDUCATIONAL SYSTEM

Education is largely in the hands of the Christian missions but all schools and teachers must be registered with the Education Department, which controls the curriculum and general standards. Besides maintaining an increasing number of schools of its own, the Government makes available grants-in-aid to mission schools which meet certain conditions.

The educational system is regulated by the Education Ordinance of 1955 and is administered by a Chief Education Officer, five education officers and clerical staff. In addition, the ordinance established an advisory committee comprising the Chief Education Officer, two other government officers and up to eight persons nominated by the controlling authorities of the mission schools, whose function it is to advise the Resident Commissioner on educational matters in the Colony.

Education is compulsory between the ages of 6 and 16 and is for the most part provided in all-age village schools without differentiation into primary and post-primary levels. The full graded primary course lasts 8 years and comprises a 2-year infant school (primers 1 to 4) and standards 1 to 6. Education is initially in the vernacular but by standard 4 English has become the medium of instruction, the vernacular continuing as second language. The two top primary classes (standards 5 and 6) form an intermediate stage and are roughly equivalent to the first two years of secondary education (forms 1 and 2). The full secondary course lasts 5 years (forms 1 to 5).

Other types of education provided include teacher training and various vocational courses. Beyond this level a few students are sent overseas, principally to the Central Medical School, Fiji, and Ardmore Teachers' College, New Zealand. An increasing number will be sent overseas for higher, including university, education in the future.

TYPES OF SECONDARY EDUCATION

Each of the principal missions conducts schools which are aspiring towards secondary standard and one of them has reached the fifth form of secondary school work. Entry to these schools is by selection rather than examination.

The only institution providing a full 5-year course is the King George V School, a government boarding school for boys, with an enrolment of 120. A similar boarding school for girls, with accommodation for 60 pupils, was opened in 1959. Both these schools are at Tarawa.

The secondary course prepares pupils for the General Certificate of Education examination of London University. It will shortly be modified to prepare them for the Cambridge Oversea School Certificate and Cambridge General Certificate of Education examination.

The curriculum includes English language and literature, history of the British Commonwealth, geography, mathematics, health science, art and local crafts, woodwork, physical education and singing. General science is taught in the lower forms and will be continued until the fifth form when staffing permits. Stress is laid on practical work and adaptation to local conditions.

Vocational and technical education. The government departments train their own fitters, mechanics, wireless operators, nurses, clerks, etc. The British Phosphate Commission Apprenticeship Scheme offers courses for electricians, plumbers, welders, fitters, carpenters, painters, boilermakers and other skilled occupations.

Teacher training. A new teachers' college at Tarawa has 16 students in training per year. The Missions also have arrangements for pastor/teacher training in their own institutions.

Out-of-class activities. Sports and team games are taught at government schools. At King George V School and the larger mission schools club activities are well established and include stamps, chess, dramatics, etc. At government boarding schools traditional native singing and dancing are kept alive.

TRENDS AND PROBLEMS

Until recently secondary education has been handicapped by the low standard of education generally and the shortage of teachers capable of undertaking the work. Owing to the improved supply of teaching materials and books in government schools and to the fact that more and more teachers who have spent a year in New Zealand are now teaching on outer islands, many good candidates for the government secondary schools are coming forward. It has been possible to lower the age of entry to 12 or 13 and the problem of wastage is being overcome. This trend will gather momentum as more students complete the course at the new teachers' college.

One of the objects of the government secondary schools is to provide staff for the various Colony services. From 1961 on there will be a regular output of boys with an overseas school certificate or certificate of education available for training for higher posts in the Colony and for study overseas. Girls' education still remains behind that of boys,

but the opening of the new girls' secondary school has marked a great step forward.

STATISTICS

Population (mid-year 1958 estimate): 44,000.
Area: 349 square miles; 905 square kilometres.
Population density: 126 per square mile; 49 per square kilometre.

Summary of school statistics, 1953–57. In 1957 there were 8,453 pupils enrolled in primary and secondary schools representing over 21 per cent of total population. The proportion of girls enrolled was about 42 per cent in primary schools and 22 per cent in secondary schools. The teaching staff numbered 314 and the average pupil-teacher ratio was 27. (See Table 2.)

Examination results in secondary education, 1953–57. In the school year 1956/57, 120 candidates passed the local secondary school leaving certificate and one passed the New Zealand School Certificate examination. No information is available on the number of girl candidates.

Educational finance, 1956. Total public expenditure on education in the fiscal year beginning January 1956 amounted to 23,512 pounds sterling, or approximately £0.6 per inhabitant. Of this sum, £1,000 was contributed by the United Kingdom, £750 by local authorities and the remainder (£22,062) from territorial revenue. Capital expenditure amounted to £300 or just over 1 per cent of total. Distribution of recurring expenditure by level and type of education is shown in Table 1.

1. In addition there were mission pastor/teacher training courses.

PITCAIRN ISLAND

Education was formerly in the hands of missionaries but is now a government responsibility. It is entirely financed from the island resources, obtained largely by the sale of stamps. The inhabitants make no direct contribution.

There is one education officer and one assistant. A new school and community centre equipped with modern teaching aids was completed in 1949. All education from kindergarten to the secondary stage is conducted in this school, which is inspected by the Western Pacific High Commission at intervals.

The education officer adjusts the curriculum to suit the current needs of the children. General subjects, handicrafts, hygiene and physical education, music and art are taught. Gardening, particularly the growing of fruit trees, is an important part of the curriculum.

Secondary education was begun in 1957, when courses from the New Zealand Correspondence School were introduced. Pupils desiring further education go to New Zealand or Australia.

Adult education, based on individual needs, is also the responsibility of the education officer. There is a close link between the school and the community.

The children are regularly inspected by a qualified nurse resident on the island.

[*Text revised by the Colonial Office, London, in March 1960.*]

STATISTICS

Population (mid-year 1956 estimate): 143.
Area: 2 square miles; 5 square kilometres.

Population density: 72 per square mile; 29 per square kilometre.

TONGA

The Tongan or Friendly Islands, situated in the Southern Pacific some 450 miles east-south-east of Fiji, form a self-governing State under the protection of the United Kingdom.

Schools are provided by the Government of Tonga and by a number of church organizations, the chief of which are the Wesleyan and Roman Catholic missions. General responsibility for education is vested in a Minister of Education who is assisted by an advisory board. The administrative staff at the Education Office consists of the director, a senior inspector of schools, three organizing inspectors and an attendance officer. The church schools receive no state aid of any kind. Fees are payable in all schools except government primary schools and the teacher training college.

The Education Act of 1927 requires compulsory attendance at government primary schools of all children, aged not less than 6 and not more than 14 years, who are not in attendance at some other primary school. Exemption is granted on the grounds of distance from a government school, sickness, etc., and to pupils within these age limits who have completed the 6-year primary course. The compulsory period does not include any part of the secondary stage. All primary schools except one or two mission schools are co-educational, but all except 5 of the 21 post-primary schools are single-sex institutions. Tongan is the language of instruction in all but the top class of the primary school. At the post-primary level the language of instruction is English but Tongan remains a compulsory subject for examinations.

Secondary education is provided at three government institutions, Tonga High School, Tonga College and Teachers' College and at the colleges run by the missions. Although the normal primary school course lasts 6 years, pupils who have completed class 5 may sit the entrance tests to the various secondary schools. These tests are usually set by the headmaster of each college, although the government test may be used by other schools. Until 1957 the government entrance tests consisted of papers in mechanical arithmetic and formal English, but in that year these were replaced by a battery of four tests: a 'best reason', a 'problem arithmetic' and vocabulary test in

Tongan and a vocabulary test in English, all standardized for Tongan schools.

There is at present a differentiation in course between Tonga High School and the other secondary schools. Tonga High School admits selected pupils at the age of 11 years who will follow the New Zealand syllabus leading in six or seven years to the New Zealand School Certificate examination. Pupils entering Tonga College and the mission colleges take a 7-year course based on the Government of Tonga's post-primary curriculum, which leads to the local Higher Leaving Certificate and Public Service Entrance. The Higher Certificate is at a somewhat lower standard than that of the New Zealand Certificate, particularly in English. In the Leaving Certificate examination English, Tongan, elementary mathematics, hygiene and first aid are compulsory, and two optional subjects must be chosen from among the following which are usually regarded as part of the curriculum at all colleges: Tongan handicraft, history, geography, drawing, general science, needlework, agriculture, music, woodwork, domestic science, elementary mechanics, animal husbandry.

The course at Tonga College has a vocational bias. This college is a boarding establishment for boys selected from village schools. It has a farm of approximately 200 acres and is practically self-supporting.

The minimum academic requirement for entry to the government teacher training college is the Lower Leaving Certificate, which is taken at the end of the fifth year in the syllabus followed by secondary schools other than Tonga High School. However, since students also enter with the Higher Certificate taken at the end of the seventh year, training is carried out at two levels.

Under the Scheme of Co-operation between the Governments of Tonga and New Zealand, several of the senior posts at Tonga High School and Tonga College are filled by teachers recruited in New Zealand.

The secondary education facilities in Tonga are supplemented by government bursaries enabling suitable pupils to attend secondary schools in New Zealand. There is no post-secondary education in Tonga but the Government provides scholarships for university, teacher training and technical training courses abroad, particularly in New Zealand and Fiji.

TRENDS AND PROBLEMS

The development of government post-primary education and the introduction of vocational and industrial training courses are contingent on the enlargement of Tonga High School. Work is going ahead and when the new building is completed it is proposed to double the intake and to introduce a broader curriculum, while continuing to provide facilities for the highly academic few who will go on to further education overseas. At the same time Tonga College, relieved of its more academic functions, will become a vocational training school providing courses in woodwork, metalwork, elementary mechanics and various aspects of farming and agriculture. It will then become possible to integrate the local Leaving Certificate syllabus and the New Zealand syllabus.

Mission schools still account for over 80 per cent of the secondary school population. One school has organized its lower secondary classes as a separate intermediate school.

The recent overhaul of the whole school syllabus in Tonga and the introduction of new methods in place of formalism and rote learning is being reflected in a general improvement in standards up to and including the Higher Leaving Certificate level.

TONGA. DEPARTMENT OF EDUCATION. *Report for the year. . . .* Nuku'alofa. Government Printer.

STATISTICS

Population (mid-year 1958 estimate): 58,000.
Area: 269 square miles; 697 square kilometres.
Population density: 216 per square mile; 83 per square kilometre.

Summary of school statistics, 1953–57. In 1957 there were 15,873 pupils enrolled in 157 primary and secondary schools and 1 teacher training college, representing nearly 28 per cent of the total estimated population. Enrolment increased by 14 per cent in the primary schools and 37 per cent in the secondary schools between 1953 and 1957 and the number of teachers by 59 per cent over the same period. The average pupil-teacher ratio in primary and secondary schools was 25 in 1957 compared with 33 in 1953. (See table.)

Educational finance, 1957. Total expenditure on education in 1957/58 was 213,017 Tongan pounds, or about £3.7 per inhabitant. Of this total 40 per cent (£84,492) was public expenditure and 60 per cent (£128,525) was spent by missions. Official exchange rate: 1 Tongan pound = 2.24 U.S. dollars.

UNITED STATES OF AMERICA

THE EDUCATIONAL SYSTEM

In the United States of America the present trend in public education is for local communities to provide tax-supported and publicly-directed schooling for all from the age of 5 to the age of 20, that is, from kindergarten through two years of college. Nine years of this 15-year sequence, from age 7 to 16, are now compulsory in two-thirds of the states. Other states require school attendance to ages 17 or 18. Six states set the minimum compulsory attendance age at 6, six others set it at 8.

While the number of publicly-supported kindergartens for children under 6 is increasing each year, there are as yet few publicly-supported nursery schools. The number of privately-financed nursery schools, however, is growing steadily.

Elementary schools, embracing the first 6 or 8 grades of the elementary-secondary 12-year sequence, enrol virtually the entire elementary school-age population, boys and girls alike, in both urban and rural areas. Secondary education in the United States aims at including all youth of secondary-school age, thus offering 12 years of schooling to every boy and girl throughout the country. At present, 80 per cent of the young people of secondary-school age are enrolled, and 62 per cent of them graduate. Each year both percentages increase, bringing nearer the establishment of universal secondary education.

To comply with compulsory attendance laws, parents may send their children either to the public schools or to private or church-supported institutions. However, public funds have not been used to support either private or church-connected schools and the parent has had to meet the full cost of such education, in addition to paying his share of the tax for support of public schools.

Above the secondary level are the colleges and the universities with their graduate and professional schools. There are also junior colleges, the number of which is growing rapidly. These junior colleges provide two types of curricula: (a) the first 2 years of the traditional 4-year college course; (b) a 2-year terminal course of technical training.

The area of college, university, and professional education is shared by privately and publicly-supported institutions. State universities and municipal colleges rely upon public funds rather than upon income from endowment, current gifts, or student fees; in most of these

institutions fees are low. With few exceptions, institutions of higher learning are selective in their admission policies and each one insists that students meet its scholastic standards in order to continue their studies.

The way in which the various levels of the educational system are interrelated is shown in the diagram on p. 1365.

The provision of education (statutory base). The United States operates within the framework of a federal system in which power is shared between the Central or Federal Government and the 50 separate states which make up the Union. Education is not mentioned in the Federal Constitution, but this document clearly states that all powers not delegated to the Federal Government or denied to the states are reserved to the states and to the people. Under this provision each of the 50 states exercises sovereign control over schools and education in that state.

The Federal Government may provide essential educational programmes in those instances where states are not jurisdictionally responsible, i.e., for persons living on federal reservations located within states; for Indians and other indigenous peoples covered by treaty or international agreement; for persons living in the District of Columbia and the territories and outlying possessions of the United States; and for dependent children accompanying military or civilian personnel of the Federal Government at overseas stations.

The Federal Government may engage in other educational activities under the constitutional authority to levy and collect taxes for the common defence and the general welfare of the United States.

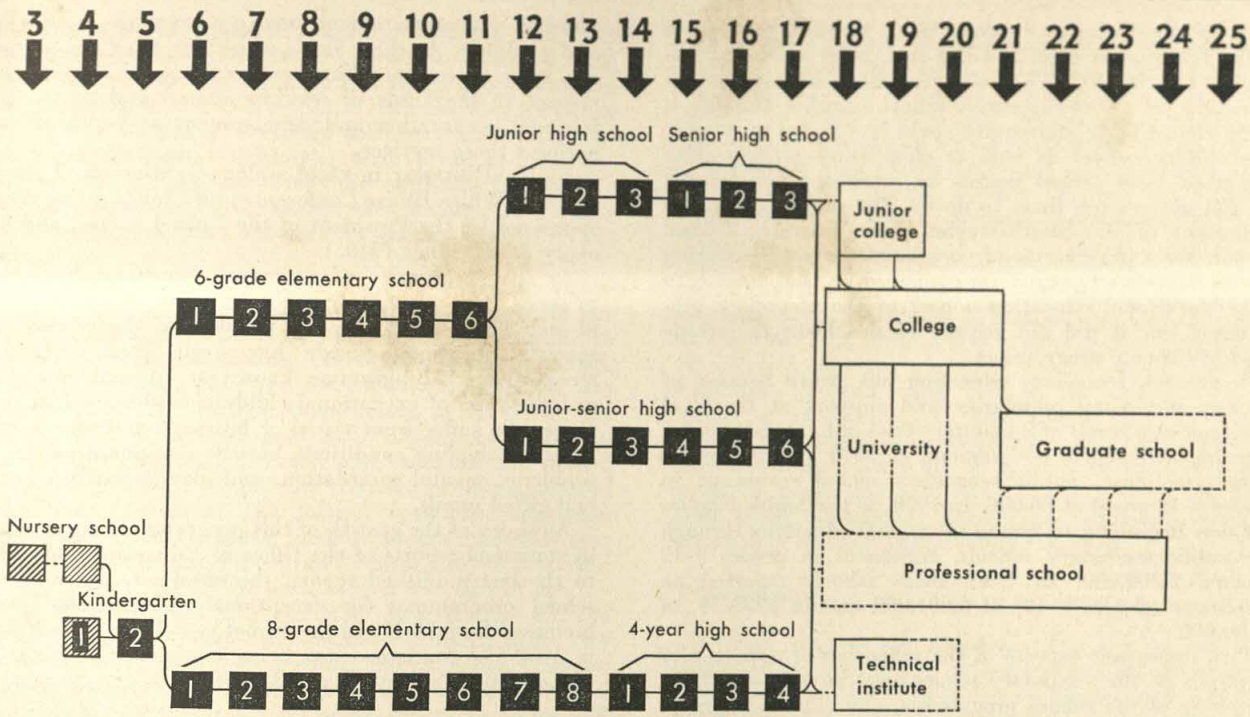
In respect of the territories belonging to the United States, it has been the policy of Congress to create territorial governments and delegate to them powers similar to those of states wherever possible. Thus, most schools operated in the territories are under the direct management and control of territorial governments.

There is in the United States a strong tradition that a large measure of control over education and the schools should rest with the local community. State statutes and directives define minimum standards for schools, the taxing power of the local community for education and other questions of this character, and leave to the locally selected school board the responsibility for providing education in conformity with state regulations. In general, teachers are licensed by the state education authority, but are appointed to teaching posts by local authorities. Local financial support varies with the resources of the local communities and their interest in education. Many states provide equalization funds from state sources to upgrade the schools in poorer communities. In general, such subsidies from state funds do not diminish local control.

Factors affecting the provision of education. One ethnic factor has influenced the development of schools in the United States, namely the practice of segregation of Negro pupils in the schools in some Southern states. In 1897, the Supreme Court of the United States upheld the legality of this practice on the part of the states provided that the quality of education in schools for each race be equal. In its rulings of 1954 and 1955 the Court reversed the earlier decision and declared compulsory segregation to be inherently unequal. Since 1955 desegregation has proceeded rapidly in five states and the District of Columbia. In other states no changes have taken place and in a third group changes have been few.

A religious factor influencing the system of schools in the United States is the provision in the Federal Constitution for the separation of Church and State. This provision, which prohibits the teaching of sectarian religion in the public schools, resulted in the growth of schools sponsored and supported by religious denominations, of which by far the largest proportion is supported by the Roman Catholic Church. There are some Lutheran schools and a few run by other denominations, although in general the Protestant groups do not operate schools.

Public schools in the United States are not organized on the basis of linguistic, social, or cultural factors. In spite of the large immigration into this country, the English language is the language of instruction. In a small number of schools attended by Indian children, a tribal language is sometimes used initially to a limited extent. However, the transition to exclusive use of English is made as quickly as possible. The Indians themselves favour this policy.



Role of public authorities. The role of public authorities at the federal and state levels is clearly defined. The U.S. Office of Education (which corresponds to the national ministry of education in many countries) has a mandate to collect statistics on the state of education in the nation and to make information about education available to schools and school authorities. It performs a research and clearing-house function, rather than an administrative one, with respect to school systems. It administers the subsidies for education appropriated by the Congress of the United States—for the most part these funds are used for vocational education, science and mathematics, modern languages, guidance, and research in the field of education.

The division of powers between state and local authorities in the 50 states is more marked and more varied. Each state has a department of education which is responsible for the enforcement of state statutes on education. Local autonomy within the framework of the state statutes is, in general, the system adopted in each state, but the division of power between state and local authorities varies from one state to another.

Role of private agencies. Non-public schools in the United States are primarily of two types: church-sponsored and operated, and independently supported and operated. The local agency operating church-sponsored schools is the parish which, in the case of Catholic schools, is responsible to the diocesan superintendent. As the term implies, independent elementary and secondary schools are unaffiliated with any religious group but are owned and operated by an individual or corporation. All of these schools must conform with state requirements for non-public schools.

THE DEVELOPMENT OF SECONDARY EDUCATION

Two landmarks stand out in the history of secondary education during the last 85 years: a decision handed

GLOSSARY

elementary school: primary school; organized to include 6, 7 or 8 grades of school, and the kindergarten and nursery school in school systems which maintain them.

high school: secondary school. The secondary level of education includes academic, general, vocational and business programmes.

kindergarten: pre-primary school or classes.

nursery school: pre-primary school preceding *kindergarten;* schools of this type are included in only a relatively small number of public school systems.

HIGHER EDUCATION

college: (a) an institution of higher education usually offering a curriculum in the liberal arts and sciences, and frequently one or more professional curricula in addition, empowered to confer bachelors' degrees for 4-year programmes and/or associate degrees for 2-year or 3-year programmes; (b) that undergraduate division of a university which corresponds in programme and function to (a).

graduate school: a major division of a university administering programmes of study requiring for admission a bachelor's or a first professional degree and leading to a master's and/or doctor's (Ph.D. or equivalent) degree.

junior college: a post-secondary school usually offering a 2-year programme either as preparation for transfer to the third year of a 4-year college or as preparation for a technical or semi-professional occupation. Adult education classes are sometimes provided.

professional school: an institution organized as a major division of a college or university, or independently organized, which provides education and training that qualifies for the practice of a profession such as architecture, dentistry, education, engineering, law, or medicine. Schools for some professions admit students who have been graduated from secondary schools; schools for other professions admit only students who have completed a pre-professional curriculum in a college of arts and sciences.

technical institute: the technical institute provides post-high school programmes of 1, 2 or 3 years' duration frequently leading to the associate degree. Although many of the courses in such institutions are not accepted for transfer credit by 4-year colleges and universities, most of the programmes are definitely of college grade. Some technical institutes are separate institutions offering only specialized technician training. The majority are divisions of universities or of junior colleges.

university: a complex institution of higher education usually comprising a college of liberal arts and sciences, two or more professional schools, and a graduate school, and sometimes a junior college. The word 'university' is also used in the titles of some institutions of higher education which are in reality only colleges.

down by the Michigan Supreme Court in 1874, referred to as the Kalamazoo case, and the enactment of the Smith-Hughes Law in 1917. The first event made mass secondary education in a tax-supported school possible through a ruling that a local community could levy taxes to support a secondary school as well as elementary schools. This permitted local school boards to establish high schools but did not require them to do so. The second event, the enactment of the Smith-Hughes Law, provided federal support for a programme of vocational courses by offering federal subsidies to states for communities that wanted to make vocational education a part of the secondary programme, but it did not require local schools to include these vocational programmes.

In general, secondary education has grown because of steadily increasing popularity and support at the local level, not as a result of mandatory laws or financial support from higher levels of government. In 1870, just before the Kalamazoo case, public secondary school enrolment in grades 9–12 stood at 80,000. In 1920, as the Smith-Hughes Act was beginning to spread vocational education through the public secondary schools, enrolment in grades 9–12 reached 2,200,000. In 1940, these schools reported an enrolment (grades 9–12) of 6,601,000 and in 1958–59, of 7,790,000.

Two important aspects of the extension of opportunity to pupils at the secondary school level have been (a) the enriching of the school programme, and (b) the improvement of the quality of teaching. The secondary school programme has changed as the ideas of Pestalozzi, Froebel, Herbart, Parker, and Dewey have influenced educational thinking. Teachers trained in educational methods based on pedagogical research have improved the quality of education for all pupils.

The American high school at the turn of the century concentrated chiefly on teaching the academic subjects—English, classical and modern languages, mathematics, sciences, history and civics. The twentieth century has witnessed the emergence and development of the high school as an institution which provides for the needs of all boys and girls of secondary school age.

Some schools offer a work experience programme—usually as part of the vocational programme, but sometimes as part of general education—in which pupils attend school part of the day and work part of the day under supervision of the school. They receive school credit for their work and frequently are paid for it as well.

A programme representing the technological aspects of American culture and included in the general education course is the industrial arts programme. Although non-vocational in nature, industrial arts deals with industrial processes—tools, machines, raw materials, products, and occupations representative of American industry. The narrow concept of manual training which had been introduced into the schools prior to 1900 was discarded in favour of a broad representation of modern industry.

Other developments in secondary education since 1900 came about as the result of critical times in the national life. World War I, the economic depression of the 1930s, and World War II emphasized certain student needs and resulted in the establishment or extension of various welfare services, e.g., health supervision and instruction, physical education, school lunch programmes, counselling and guidance. As these fields of service have grown there has been a corresponding increase in specialization with respect to the kinds of services offered and to the professional preparation and development of personnel who perform these services.

National interest in child welfare is illustrated by the series of White House Conferences on Children and Youth sponsored by the President of the United States, and held every decade since 1910.

As the programme of secondary education broadened to serve more adequately the needs of more young people of secondary school age, the problem of those who have special educational needs has been given increasing recognition. A programme known as 'special education' or 'education of exceptional children' is designed to serve those who suffer from visual or hearing handicaps, speech defects, crippling conditions, serious emotional and social problems, mental retardation, and also specially talented and gifted pupils.

An index of the growth of this programme may be found in statistical reports of the Office of Education. According to the last published report, the enrolment in secondary school programmes for exceptional children and youth increased from 18,150 in the school year 1937/38 to 108,058 in 1952/53.[1] Statistics now being compiled by the Office of Education indicate that this increase is continuing.

Legal basis

The state systems of free public schools are established by state legislatures, usually under constitutional mandate. The Constitution of Kentucky, for example, directs that the General Assembly 'shall, by appropriate legislation, provide for an efficient system of common schools throughout the state'. The Kentucky General Assembly has defined the term 'common school' as 'an elementary or secondary school of the state, supported in whole or in part by public taxation'.

All states have explicit legislation authorizing the establishment, maintenance, and support of public high schools and all now require that local school districts provide secondary education opportunities. In some states, if a local school district does not choose to operate a secondary school it may meet the requirement 'to provide secondary education opportunities' by sending pupils of high school age to public high schools maintained by neighbouring districts, or sometimes to approved non-public schools. Many states which promoted the initial establishment of public high schools by grants-in-aid still employ this means to encourage specific improvements in secondary education.

As educational institutions non-public high schools are subject to regulation under state laws dealing with their establishment and approval. Moreover, in the normal operation of their activities, non-public schools must accept responsibilities prescribed by law for the conduct and care of the children and young people they enrol. They

1. Mabel C. Rice and Arthur S. Hill, 'Statistics of Special Education for Exceptional Children, 1952–53,' *Biennial Survey of Education in the United States*, Chapter 5. Washington, D.C., U.S. Government Printing Office, 1954, p. 78.

may be expressly required to keep records and make any reports to state officials that are needed to establish valid legal evidence that the children and young people enrolled are attending school in compliance with the law; they may be expressly required to remain in session for a term that compares favourably with the term prescribed for the public schools; and they may be expressly required to provide educational programmes that compare favourably with the programmes required in public schools of like nature.

Vocational education. Public vocational education at the secondary level was a relatively late development in the United States. Wisconsin, in 1907, was the first state to enact legislation authorizing the establishment of public industrial schools. The need for vocational education was recognized by the Federal Government in 1917 with the passage of the Smith-Hughes Act. Subsequent legislation enacted by Congress increased and extended the federal assistance provided to states by that act for programmes of vocational education. The federal vocational education acts limit the use of federal funds to programmes that are: (a) under public supervision and control; (b) of less than college grade; and (c) for persons over 14 years of age.

The federal-state programme of co-operation for the development of vocational education is based upon two fundamental ideas: (a) that vocational education is in the national interest and is essential to the national welfare, and (b) that federal funds are necessary to encourage and assist the states to make adequate provision for such training.

The law requires that each state appoint a board responsible for the promotion, development, improvement, and supervision of vocational education within the state. In 45 states, the state board of education for the state system of free public schools also serves as the vocational education board. Vocational schools may be operated within local school districts under the operational management of district boards of education or they may be operated regionally by the state board for vocational education.

Apprenticeship programmes are supervised and regulated under federal and state law. Related educational requirements for apprenticeship programmes are usually provided for under federally aided state programmes of vocational education.

Compulsory education. In 47 of the 50 states at least nine years' schooling is required by statute. With the maximum school age-limit for compulsory attendance ranging from 16 to 18 years, normal grade promotion in each of these states assures pupils of at least some education at the secondary level. Free public education opportunities below the college level are available to all children and young people in the United States under 21 years of age.

Child labour laws of both the State and Federal Governments help to enforce compulsory education legislation. Such laws govern the employment of young people of school age. Work permits may be issued to children of school age under conditions prescribed by state or local authorities. These permits usually stipulate that work must not conflict with hours of school attendance, or that the young person must attend a continuation school at night. Requirements vary so widely from state to state in this respect that it is difficult to generalize.

The enforcement of attendance laws in the United States is rapidly becoming a matter of discovering what causes the absence of pupils and helping to remove these causes. In many local school districts, responsibility for this work is now placed with a skilled school social worker. A number of states have state-wide associations of attendance officers or 'visiting teachers' as they are sometimes called. There is also a National Association of Visiting Teachers.

Compulsory attendance legislation may provide exemption for: (a) children who are seriously handicapped, mentally or physically; (b) children of certain ages and educational attainments who have obtained official state permits; and (c) children who are unable to attend school because of conditions beyond their control, for example, serious illness or remoteness of their homes from the nearest school. Technological developments, i.e., radio, television and telephone, now make it possible to bring the classroom to many children who previously were exempted from school attendance. Many school districts now employ teachers to instruct 'homebound' children.

Administration

The final decision of questions of policy in secondary education is made by one or both of two groups of authorities: (a) the chief state school official and the state board of education; and (b) the local superintendent and local board of education. In most cases where major questions of policy are involved the authority making the decision usually consults the other, even though it may have the power to act alone.

Many of the states prepare courses of study for the secondary schools. The course of study is regarded as suggestive rather than prescriptive; considerable latitude is thus permitted the school and the teacher. When a new course of study is to be prepared, a state committee is set up composed of secondary teachers, professors of education, and professors in the subject area. In many cases a very large committee discusses the general outline and a smaller working committee writes the course, which cover both subject content and methods of teaching. Very frequently the course of study is printed, tried out in selected schools, and revised on the basis of the trial experience.

Very often, especially in large urban and suburban school districts, the local school system itself prepares courses of study or curriculum guides, as they are frequently called. As at the state level, their preparation is carried out not only by supervisors and consultants; many teachers who will be using them as guides in teaching their classes are also members of the working committees.

In most states, a state textbook committee draws up a list of textbooks for each subject from which local schools make their choice. In a few states, however, a single textbook is adopted for each subject, while in many others each school or school district selects all textbooks without the intervention of the state education officials.

The Federal Office of Education does not make recommendations on curriculum, methodology, or textbooks. It may call general attention to programmes which show promise of helping to solve persistent educational problems.

Control. The system of free public schools in each state is headed by a department of the State Government, commonly called the state department of education. The administration and direction of this department is entrusted to a state board of education or a chief state school officer or both. The chief state school officer is responsible for the technical administration of the department.

State departments of education have various responsibilities including the exercise of such regulatory powers as are delegated to them by state legislatures. No two departments are organized and administered alike, although there is a marked similarity in departmental functions from state to state.

The duties and responsibilities of state departments may be grouped under three broad headings: (a) Leadership—advising and consulting, planning, co-ordinating, public relations work and research for the state educational system; (b) Regulations—insuring system-wide conformity to state laws and administrative rules establishing minimum performance standards; (c) Operation—direct management and control of state-wide programmes that cannot be effectively or efficiently administered locally.

With few exceptions, the public schools below the higher education level are local schools, in that they are operated for, and primarily supported by, the people residing in political subdivisions of the state, commonly called local school districts. There are approximately 40,000 of these districts in the United States, ranging in size from small rural districts employing one teacher, to large city districts operating more schools than some of the smaller states. Approximately 14,600 of the local districts operate high schools. The affairs of districts are generally managed by lay boards whose members are residents of the district in which they serve. Board members are usually elected by the qualified voters of the district.

Since the Federal Government makes appropriations for the promotion and further development of vocational education, the U.S. Office of Education is responsible for the administration of the federal vocational education acts. The office therefore maintains a staff of specialists in vocational education working at the national and interstate levels, with public and private agencies and groups, on activities relating to the programme. In addition, the office co-operates with the states in identifying the instructional needs of individuals and communities on the basis of occupational opportunities and trends. Co-operation is given to the states also in planning, organizing, supervising, and administering programmes as well as in the development of instructional materials and suitable standards for vocational education facilities.

The state board for vocational education prepares an outline of the vocational education programme for which the state will use federal funds and it specifies how the programme will be operated and the teachers trained. The Federal Government reviews state programme operations to determine whether they conform to the state plans. Programmes in local school districts are thus to be found operating in conformity with the plans prepared by the state and approved by the Federal Government.

Supervision and inspection. Except in the area of vocational education, the U.S. Office of Education has no responsibility for the supervision of schools, but it provides consultative or advisory services to the various states and territories upon request. Each state and territory has on the staff of the department of education one or more persons responsible for the supervision of secondary schools. The persons who serve in this capacity act chiefly as advisers or consultants to local school districts. They are referred to as supervisors, directors, consultants, or assistant superintendents. The supervisors, as they will be called in this report, may be general or special supervisors. General supervisors concern themselves with the general overall supervision of the schools, while special supervisors are responsible for certain subject-matter areas or specific aspects of education, such as vocational education or the education of exceptional children.

In some states, the state department of education carries heavy responsibility for approving high schools to receive state funds and for formally approving or accrediting schools or for recommending schools for accreditation. Formal approval or accreditation involves periodic evaluation of a school in terms of the minimum standards established by the state department. Either alone or as a member of a team the supervisor participates in the periodic visits, in reviewing the required annual reports of the school, and in making the official rating.

Inspection as such is tending to disappear as a function of state department personnel and a growing emphasis is placed upon improving instruction through providing professional help for teachers and administrators. The duties of the supervisor include the conduct of or help in conducting school surveys, participation in self-evaluative studies by local schools, and assisting in curriculum development and in-service education.

In the city, county, or other local school system, supervision takes the form of advisory or consultative services and is the responsibility of general or special supervisors, heads of departments, assistant superintendents, co-ordinators, or directors of instruction or curriculum. In the smaller school systems the principal may be responsible for supervision. At whatever level supervision is exercised, it is concerned with the improvement of the educational programme, the in-service education of teachers, and with the strengthening of school-community co-operation through leadership. Observation is only one of the techniques used. Very little school visiting is done according to a regular schedule. Instead, supervisory visits are made when schools or teachers request them or when supervisors believe that such visits are needed.

In the local school districts, a supervisor is usually a person who has had several years of teaching experience, holds at least a master's degree with an emphasis on professional education, and possesses an ability to work with professional and non-professional personnel. Most state departments of education require similar qualifications for their supervisory personnel.

Supervision of programmes of vocational education is carried out at the state and local levels by persons whose qualifications and duties are set forth in the state plan for vocational education. Supervision is looked upon as a means of improving instruction through assisting teachers to continue to develop and enlarge their grasp of the technical aspects of the subjects they teach.

Important in the field of secondary education are the five non-governmental regional accrediting associations. These associations, each of which has assumed responsibility for accrediting schools in states in a given area of the United States, are composed of representatives of colleges and secondary schools in that area. Their evaluations of high schools, using similar standards and criteria, have a marked effect in bringing about uniformity in educational practice in the 50 states. Membership in an association, evaluation by it, and compliance with its suggestions are voluntary and outside the regular channels of state or federal control. However, to be regionally accredited does give status to a high school and accreditation is very generally sought by schools which are able to meet the regional association's standards. Regional accreditation is in addition to and apart from accreditation by the state accrediting agency.

Finance. All levels of government in the United States—local, state, and national—provide funds for free public education. Under traditional patterns of financing free public education, the schools operated by local school districts are supported largely by funds derived from local taxes. Funds derived from state taxes are usually provided in order to equalize educational opportunities throughout the state and to stimulate and encourage the introduction or expansion of particular programmes and services in local school districts. Funds derived from federal taxation are provided for specific purposes which the Congress deems essential for the common defence and the general welfare of the United States. Federal funds are now being provided to states for a variety of purposes including the promotion of vocational education, the operation and construction of schools in areas under federal jurisdiction, and the strengthening of science, mathematics, and modern language instruction and of guidance and counselling programmes.

For the school year 1955/56, the proportions of funds for free public elementary and secondary education from governmental sources were approximately: local 55.9 per cent; state 39.5 per cent; and federal 4.6 per cent. These percentages have remained essentially the same. Since information on free public education in the United States is reported for elementary and secondary education taken together, separate figures cannot be provided for the financing of each level.

Public school buildings and the initial outlay for equipment are usually paid for by local school districts with funds derived from the sale of bonds. Local school districts pay off the debt incurred by the bond sale over a period of years. Many states provide some aid for the building of schools in cases where local school districts lack the resources to raise sufficient funds by conventional bond sales. Teacher salaries, administrative costs, operation and maintenance costs, and other expenses incurred during the school year are paid from funds raised by taxation for that year.

No tuition fees are charged in public secondary schools. Most school districts provide students with the textbooks and equipment used during the school year and many provide school lunches. These latter are usually paid for in part by parents, although such programmes are substantially aided by state and federal funds and federal donations of surplus commodities.[1]

A majority of the secondary schools charge or permit the charging of admission fees to athletic contests, dances, dramatic presentations, concerts, and other school-sponsored activities. Many also assess various fees such as those for rental, use or breakage of school property, fees for items such as caps and gowns used in graduation ceremonies, cameras used on field trips, and musical instruments for individual or group instruction which are too expensive for most parents to provide. The miscellaneous fees are waived or paid by other means in cases where they would constitute a hardship for parents.

In an effort to keep students in school throughout the secondary course, provision is made to meet basic family needs through private and public welfare agencies in cases where the student's attendance at school constitutes a hardship to his parents.

The federal vocational education acts require that each dollar of federal funds shall be matched by a dollar of state or local funds or both. Federal funds for vocational education are allotted to the states on a population basis and are largely used for the reimbursement of a portion of the salaries of teachers, supervisors, and administrators. Some funds are available for school supplies and equipment but none for financing the cost of buildings. Fees are required of vocational education students in some instances, usually to cover the cost of supplies or certain special services. In general, however, vocational education in the United States is free.

Buildings and equipment. The local school districts which operate public high schools are responsible for providing school facilities. State laws and administrative regulations prescribe obligatory building and equipment standards to protect the safety and health of students, employed personnel, and others who will use the facilities, and to insure the functional adaptability of the facilities to the approved state educational programme. State departments of education usually supervise the school building activities of local districts in matters pertaining to the educational programme and also provide consultative and advisory services for the planning or execution of such programmes. They inform the districts of pertinent state standards and make available professional services designed to encourage districts to provide facilities that best meet their needs. The state departments of education in many states are empowered to enforce certain minimum building standards having direct educational implications, particularly in those instances where state building funds are being provided.

School welfare services. Among the services in which schools share responsibility with other community agencies are

1. In order to be eligible for either funds or surplus foods for a school lunch programme, certain requirements must be met. The programme must be operated on a non-profit basis; lunches must be served either free or at a reduced cost to children who cannot afford the full cost; and the meal must meet minimum nutritional standards established through research. Each day's lunch is supposed to supply approximately one-third of the pupil's daily requirement for calories, vitamins and minerals.

those pertaining to health and welfare. These services contribute to child growth and development, help the child take advantage of his educational opportunities, facilitate adjustment and protection, and supplement or extend the school programme. The welfare services of the schools are largely preventive, but the schools also work in co-ordination in many ways with welfare, health, and other agencies in developing adjustment or corrective procedures.

Among the responsibilities of the schools relating to the welfare of school children are instruction in basic health concepts and needs; the provision of facilities meeting at least the minimum state and local requirements as to lighting, heating, sanitation and drinking water; insuring the safety of children on the playground and when crossing streets near the school; transporting children to and from school and on school-sponsored field trips and other school-related activities; and the provision of school lunches.

In these programmes there are several patterns of administration, although in general a large measure of authority is exercised at the local level. Three constituent agencies of the U.S. Department of Health, Education, and Welfare—the Office of Education, the Children's Bureau, and the Public Health Service—carry on programmes at the federal level for the health and welfare of children. The major role of the Federal Government in this field lies in the areas of research and technical consultative services. Both the Public Health Service and the Children's Bureau, however, also make grants to states to assist in the provision of needed health and social services.

TYPES OF SECONDARY EDUCATION

Secondary education in the United States may be either a 6-year or a 4-year programme. When it is six years in length, grades 7 and 8, which are otherwise part of elementary education, are included in a junior high school or a junior-senior high school. When grades 7 and 8 are a part of the secondary school the programme is normally somewhat broader than it is when these grades form part of the elementary school. The pupils usually receive instruction in a departmentalized situation, i.e., they are taught by a different teacher for most of their seven or eight subjects, rather than in a self-contained classroom. There are few if any elective subjects in these lower secondary grades.

The programmes of seventh and eighth grade pupils in the secondary school consist of the following subjects in one or both years: English, history, geography, arithmetic, general science, industrial arts or homemaking, health and physical education, art, and music. In general, one or more elective subjects are introduced in grade 9.

Most high schools in the United States are comprehensive high schools, that is, they are not selective in the subjects offered or the pupils enrolled. Americans in general believe that a high school should be a universal common school providing opportunities for all boys and girls in the area it serves to receive the kind of instruction that will best develop their individual potentialities. Specialized high schools are usually found only in the largest cities. A recent study showed that of 18 cities of above 500,000 population 16 have from two to seven different types of high schools. The most common types of specialized schools are the vocational, vocational-technical, technical, commercial, and academic.[1]

In the past, specialized schools in larger cities were numerous and many cities maintained both an academic and a vocational high school. In a few, there were separate high schools for boys and girls. Now, however, in most school districts there is only one type of secondary school available to the pupil who wants to attend a free public school—the comprehensive high school in the district where he lives. In this school the pupil may elect to follow one of three or four or more different courses. Usually these are the academic or college preparatory, vocational and business courses, and a course of general studies which does not prepare for college or a specific vocation.

Small comprehensive high schools usually offer a single curriculum, that is, required subjects plus electives. Approximately 50 per cent of the high schools in the United States enrol fewer than 200 pupils. These schools can, of course, provide only a limited number of courses; they do not succeed in offering everything for all types of pupils. Their purpose, however, is the same as that of the larger comprehensive high school with multiple curricula.

Guidance. To help pupils and their parents in choosing suitable programmes and courses, secondary schools provide a guidance service, which assists the individual pupil in educational and vocational planning and in making personal and social adjustments.

In planning the pupil's studies consideration is given to his elementary school record, his ability as indicated by his past achievement and test scores, his interests, and his vocational aspirations. A cumulative record concerning these and related matters is usually kept during elementary and secondary school years. The planning interviews are held at intervals throughout the student's schooling, so as to help him to develop a programme of studies appropriate to his own purposes. Within the limits of available elective subjects, and the basic curriculum he has chosen, he is free to make his own choices subject to approval by his parents, provided his record of past achievement seems to warrant his undertaking the courses selected. Normally such assistance in planning is the responsibility of specifically designated counsellors, although teachers often assist. In smaller schools the guidance service may be run entirely by teachers and the principal.

Considerable impetus was given to the development of guidance and personnel services at the secondary level by the National Defense Education Act of 1958. Provision is made in the Act for financial assistance to states for carrying out testing programmes designed to identify pupils of high ability, providing guidance services to assist students with educational planning, and encouraging students of outstanding ability to prepare for and enter institutions of higher education.

Types of further education open to secondary school leavers. Many educational opportunities are still open to secondary

1. 'High School Curriculum Organization Patterns and Graduation Requirements in Fifty Large Cities,' Washington, D.C., U.S. Office of Education, 1959. (Circular No. 587.)

school students who fail to complete the requirements for a high school diploma.

In some states continuation education opportunities are provided for those who have not completed high school and have not passed the compulsory age for attendance. Such continuation programmes, which are usually maintained only by the larger school districts, are provided in the morning, afternoon, or evening, according to the convenience of the student, who works on the job during hours when he is not attending classes.

In many states a high school diploma or a certificate of equivalency may be awarded to adults who pass the General Education Development Tests which were standardized during World War II. Other states require either attendance in specific classes or satisfactory completion of course tests before a diploma is granted.

Of the 17,000 local school districts providing education for 150 or more elementary and secondary students, more than 6,000 offer a programme of education for the adults of their respective communities. Usually these programmes include specific provisions whereby adult citizens may acquire high school diplomas. The requirements may be the same as those established by the school district for the granting of the high school diploma to secondary school students. Some communities now offer educational programmes leading to the high school diploma which are especially adapted to individual educational needs.

A number of state universities, directly, or in co-operation with the state universities of other states, provide correspondence courses at the high school level. Completion of such correspondence courses may at times be certified to the parent local school district and the diploma may be issued by the local high school.

The school year. During the school year of nine months, September to June (the exact dates varying from state to state and even from city to city), most state departments of education and regional accrediting associations prescribe a minimum of 175 teaching days, that is, days when classes are actually in session. There is a week's vacation at Christmas and another week in the spring, frequently at Easter. Certain other legal holidays are observed, often as many as four or five during the school year.

The school year may be a single term with promotion coming only at the close of school in June, or it may be divided into two semesters with promotions both at the end of January and in June. The trend is towards the end-of-year promotion only. Some systems maintain a summer school, attendance at which is voluntary.

Classes meet on five days of the week, Monday to Friday. Except for schools which because of overcrowded conditions must maintain double shifts, the length of the school day ranges from 5½ to 7¼ hours, including a lunch period of 25 to 45 minutes. Schools may schedule classes on either the short-period (40–45 minutes) or long-period (50–55 minutes) basis. If the short period is adopted, the school day will probably consist of seven class periods; with the long period, there are usually only six. A brief homeroom period may be included when pupils gather once each day for roll call and other routines, or an activity period of approximately 30 minutes when hobby clubs meet, assemblies are held, and group guidance is provided.

General secondary schools

General secondary schools in the United States, commonly referred to as comprehensive high schools, are schools of the multi-lateral type offering several different curricula, usually college preparatory, vocational, business education, and general; they may, however, offer a single curriculum of required subjects with as many electives as possible according to the size of the school.

For the most part, pupils who take the general course in a comprehensive high school lack the interest, the ability, or the aptitude to follow one of the programmes leading to college or to vocational preparation. There is no selection of pupils for the general course since both boys and girls are required by law to attend school until the age of 16, which normally means the midpoint in the 4-year secondary sequence. Those who have reached the legal school-leaving age of 16 are encouraged to stay in school at least until they can secure full-time employment. Young people who are not in school and are not employed represent an economic waste which the schools try to keep to a minimum.

Pupils choose their course—college preparatory, vocational, general or business education— with the advice and consent of their parents and their high school advisers or counsellors.

Regardless of the curriculum followed every high school boy and girl is required to take certain specified subjects. While there is some variation among states and among school districts within states, a typical pattern of subjects required of all is as follows: four years or 'units'[1] of English, two or three of social studies (including American history and government), one of mathematics, one of a science, and two to four years of health and physical education, out of a total of sixteen or more units required for high-school graduation.

In addition to these subjects required of all pupils, each curriculum except the general specifies other compulsory subjects. The college preparatory, for example, normally requires an additional year of mathematics and frequently a second year of science plus two years of a foreign language. The business education curriculum has a specialized programme including such courses as shorthand, typewriting, and general office practice. The vocational curriculum in the comprehensive high school is similar to that in the specialized vocational school and is discussed in the relevant section of this report.

To complete the total number of units required for graduation pupils elect subjects from among those offered by the school. In some instances, they are required to choose subjects bearing a relation to the curriculum they have chosen; frequently, however, they may elect freely from all the subjects available. The number and variety of subjects available in any comprehensive high school is dependent primarily upon the size of the school. The largest comprehensive high schools may offer as many as 200 different courses; the smaller schools can offer very few.

These smaller schools try in various ways, however, to

1. A unit is given for successful completion of a course meeting for at least 40 minutes a day, 5 days a week for a year of 180 days.

provide additional opportunities for their pupils. Frequently, they alternate subjects, that is, chemistry may be taught one year and physics the next. An itinerant specialized teacher may teach a course in agriculture or homemaking in two or more schools. When no teacher is available for a desired subject, the school may obtain a correspondence course from the state university which it then offers the pupil under teacher supervision.

In schools having multiple curricula a certain grouping of students by ability and aptitude is inherent in the selection of the curriculum followed. In a few large cities secondary school pupils are assigned to streams or 'tracks' on the basis of ability or aptitude. One of these cities has, for example, these four tracks: honours for the brightest pupils; regular college preparatory; general for non-college-bound pupils; and basic for pupils of below-average ability.

Some aspects of curricula and methods. Within the framework of a curriculum guide, teaching in the secondary school very generally follows a prescribed textbook, the pupils preparing each evening an assigned lesson supplemented on occasion with information from other sources. Occasionally school trips are made to examine or observe at first hand objects or activities under study. In some classes there is unit teaching, in which the work is organized under broad topics, or the problem-solving method is used; each requires some teacher-pupil planning of the activities in which the class will engage in working on the unit or problem.

It is common practice at the secondary-school level, especially in the junior high school but to a certain extent in the senior high school as well, to employ a group-guidance approach in the classroom for certain units, on subjects such as healthful living, understanding adolescent growth and development, home and family living, occupations, etc.

Frequently, units of this type are taught in a core programme the purpose of which is to assist pupils in meeting the needs most common to them and to society without regard to any subject-matter classification. Instruction centres on problem areas of needs in a two or three-period block class, utilizing the time otherwise devoted to two or more subjects required of all pupils, such as English and social studies. In developing understanding of a problem of common concern, the class carries on research and engages in other activities agreed upon through teacher-pupil planning. It sets up goals for itself, such as growth in the communication skills of reading, writing, listening, and speaking; learning to get along with others; developing cultural appreciations; extending interests; and understanding the responsibilities of democratic citizenship. On completing each four- to six-week unit of work it evaluates itself in terms of these goals.

Science and mathematics. Under the impetus of a current nation-wide interest and concern, programmes in secondary school science and mathematics are being strengthened on several fronts. Summer and academic-year institutes for teachers in service emphasize the importance of up-to-date training. The National Science Foundation makes available to colleges and universities approximately $50 million annually to pay stipends and living allowances to selected teachers. Over the past five years, approximately 20 per cent of the science teachers of the United States have benefited from these institutes.

The curriculum in secondary school science and mathematics is being revised and brought up to date by committees and commissions working at several centres throughout the country. Among the projects being carried out are the revision of the course in high school physics by the Physical Science Study Committee, the modernization of the curriculum in biology at all school levels by the Biological Sciences Curriculum Study Committee, and the preparation of a course of study in mathematics, grades 7–12, by the School Mathematics Study Group.

The National Defense Education Act, passed by the Eighty-fifth Congress, provides funds to local schools for remodelling obsolete science facilities. Funds are also available for equipment and teaching aids designed to improve and strengthen the teaching of science and mathematics, both in elementary and secondary schools.

Languages. Because of the increasing enrolments in modern languages courses and the interest in having pupils acquire greater proficiency in skills leading to real mastery of the language studied, teaching methods in this field are changing to an aural-oral approach. The use of audio-visual equipment and materials, including tapes and discs, is increasing. The National Defense Education Act of 1958 provides state grants to strengthen foreign language instruction, the funds to be used for the acquisition and installation of materials and laboratory equipment and for technical assistance. Provision is made for scholarships in institutes especially set up for training or retraining elementary and secondary school teachers in new techniques of teaching French, German, Spanish, Italian and Russian, stipends being granted to the students selected. Research grants for studies and surveys, development of specialized materials, and research and experimentation in effective use of such media as television, radio, and motion pictures are also provided for in the Act.

Work experience. This is the term most commonly used to describe work during school hours as a part of the regular school programme. Work experience education programmes are common to both general and vocational courses but, for the sake of convenience, are dealt with here together. The student may gain experience through participation in the production of goods or services, in business, in the community or in school, under the direction of the school. His work may be remunerative or non-remunerative.

The in-school non-remunerative work experience programme is most commonly scheduled for one period a day throughout the week and the school year. The out-of-school non-remunerative programme requires at least two periods per day of on-the-job work experience. The remunerative types of programmes conform generally to the half-time in school, half-time at work plan, although many business education co-operative work experience programmes operate on a basis of less than half-time at work and often are scheduled for only a portion of the spring semester of each school year. School credit toward graduation is given for work experience.

Special needs. Special methods are used at the secondary as well as at the elementary school level with the so-called exceptional children. These are the blind and partially sighted, the deaf and hard of hearing, those whose speech is

impaired, those who are crippled or who have special health problems such as epilepsy or heart conditions, the socially and emotionally maladjusted, the mentally retarded and the mentally gifted; the education provided for them is designated 'special education'.

Specially trained teachers serve the students in various ways. There is perhaps a trend in the direction of substituting more part-time special teaching for the individual student as soon as he is ready for it. Thus a handicapped student who has had full-time special teaching as an elementary school pupil, may be able to adjust quite well to regular school classes at the secondary school if he has some additional special teaching help. A hard-of-hearing student may need to continue special help in lip reading, a blind student may need special help to perfect his braille, and so on. Many schools offer special programmes of instruction for the mentally retarded adolescent.

Not a few cities now provide teachers in the detention homes where delinquent children are held pending further action. Academic teachers are also often included on the staff of a diagnostic centre or similar institution so that instruction may continue during the period when pupils are undergoing study and treatment. Similarly teachers are assigned to hospitals and convalescent homes to work with physically handicapped pupils who are hospitalized or otherwise under treatment. In cases of this sort, the teacher may become an important member of the treatment team.

Other school staff who are of great value in dealing with the complex adjustment problems of exceptional youth are the school social workers, school psychologists, and guidance counsellors.

In the preparation of exceptional young people for employment, members of the school personnel co-operate with workers from other agencies, such as vocational rehabilitation centres and employment services. Preparation for employment begins early in the child's school career with development of good attitudes and habits in relation to work, and progresses through study of vocations to schoolwork programmes both in school and out of school. The entire school curriculum contains some proportion of vocationally oriented experiences as one of its major objectives.

There has been renewed emphasis upon the improvement of educational programmes for the gifted during the last few years. Educators in secondary schools are experimenting and developing new and improved programmes to challenge these students, and in many localities superior learners are being taught at an accelerated pace. Special progress classes are arranged and gifted juniors and seniors are offered certain elective college-level courses. In some cases, colleges offer credit for these courses or other advantages (advanced college placement).

Numerous schools provide honours or special classes in various areas of the school programme for the gifted students and a lesser number set up honour schools as separate organizations within the schools themselves. Other schools rely solely upon enrichment of programmes in the regular secondary classes. Gifted students are retained in classes with others of varying ability but many materials and techniques are used in order to give greater breadth and depth to their work. Differentiated assignments, independent research and projects, and creative and experimental work are examples of enrichment procedures used.

Testing, evaluation, promotion. Achievement testing and promotion are responsibilities of the local school. There is no uniform programme of testing for the entire country. The two basic types of achievement tests are those which are prepared by teachers for use with their own students, and standardized tests prepared by co-operating groups of educators and commercial firms for use with more extensive student populations. Standardized tests are normally used as instruments for making surveys of student progress in city systems or in states, but in either case their use is voluntary. Standardized test results are also taken into account in assessing achievement for guidance purposes, but they are not used as the sole basis for assignment of grades.

Promotion is based on the earning of a required number of units of credit, and not upon a comprehensive examination at the close of the secondary school year. Current developments indicate that an increasing number of universities plan to grant advanced standing at university level to students with superior records in secondary school. In such cases the universities set the examinations by which the students' achievements are evaluated.

Reports to parents usually give the mark earned in each of the various subjects in which the student is enrolled. A number of schools have experimented with other or supplementary methods of reporting such as holding conferences with parents, sending written descriptive reports of progress, and assessment by various types of rating scales. Reports are usually made every six weeks, although practice varies considerably in this regard.

Teaching staff in general secondary schools

Training. General secondary school teachers receive their training in general colleges, teachers' colleges, and universities. Teacher preparation programmes consist of four years of higher education (beyond the usual twelve years of elementary and secondary education) leading to a bachelor's degree.

All states now require at least the bachelor's degree (4-year course) for secondary school teaching, while two states and the District of Columbia require five years of higher education. It is estimated that today, 44 per cent of the secondary school teachers in the United States of America hold master's degrees (equivalent to five years of higher education beyond graduation from a secondary school).

In college and university four-year programmes of preparation for secondary school teaching, usually half the time is devoted to liberal or general education; one-third of the remaining half is devoted to the student's field of specialization, the subject or subjects he plans to teach; one-third to professional education courses (pedagogy), including practice teaching; and one-third to elective courses.

The current interest in adding a fifth year of higher education, as a requirement for the standard or permanent secondary school teacher's certificate is owing, in large part, to a desire to ensure that secondary school teachers have a

thorough liberal or general education in addition to the necessary professional training.

Many public school systems organize and administer their own in-service teacher education programmes with or without the assistance of nearby institutions of higher education. In-service teacher education courses are also provided by institutions of teacher education in the form of evening, summer, and extension courses or through special institutes, conferences, or workshops.

Recruitment. The recruitment and placement of teachers in the United States is essentially a local operation. Each state grants certificates to teach in the secondary schools of that state. Each local school superintendent, as the executive officer of the local board of education, has full authority in the selection and appointment of teachers in the school system he administers.

Placement or employment offices for teachers are operated by institutions of higher learning which provide teacher-education programmes. They may also be operated by state teachers' associations, state departments of education, state employment services (affiliated with the United States Employment Service), and by commercial employment agencies.

Career. During the past decade in the United States there has been a great deal of public interest in encouraging highly qualified young people to take up the profession of education.

It is estimated that the average salary of all instructional staff (teachers, principals, and supervisors) in public schools increased approximately 70 per cent during the last decade. Although the cost of living also increased considerably during this period, the real wages of instructional staff probably increased by more than 40 per cent. The average salary for secondary school classroom teachers for the school year 1958/59 is estimated at $5,110. Salaries are determined on the bases of education and experience. As either or both of these factors change during a teacher's career, the computation of the amount of his base pay also changes. Most school systems in the United States have clearly stated salary schedules which are relatively simple to administer.

After a probationary period, usually of three years, a new teacher in a public school system is given tenure. Thereafter, he is dismissed only for serious unethical conduct or obvious failure to fulfil the requirements of his job. Teachers who give satisfactory service may generally look forward to yearly salary increments for 12–15 years until a stipulated maximum salary is reached.

Teachers usually teach and are paid for 10 months, September–June, each year.

Sick leave with pay is provided in practically all school systems, as a protection to children as well as an assistance to the teachers.

Retirement systems for teachers vary with state and locality. They usually indicate the age at which a teacher *may* retire and the age at which he *must* retire. The teacher contributes a percentage of his salary each month which is matched by the governmental unit administering the retirement system.

Almost every American teacher belongs to some kind of professional organization for teachers: local, state, or national. These organizations are taking a very active interest in raising the professional standards of the teaching profession as a whole; they have organized a national movement to foster this aim.

Today, approximately 55 per cent of American secondary school teachers are women.

The decision to make a career of secondary school teaching is often made by boys and girls while they are still in secondary school. The Future Teachers of America is a national organization at the secondary school level whose purpose is to encourage such vocational interest. At the college level, there is a growing Student National Education Association to help acquaint college students with the opportunities for a career in teaching.

Secondary school teaching as a career is undoubtedly gaining status and is attracting an increasing number of well-qualified young people in the United States. However, the acute demand for college teachers raises the major problem that many good secondary school teachers may be drawn away from the secondary schools to become college and university professors.

Vocational and technical schools

The vocational education programme does not replace but rather supplements general secondary education for students who want training for a chosen occupation. Vocational education is not a single subject; it is an important part of a well-balanced school programme aimed at developing mature workers, competent to play a part in economic and civic affairs.

Pupils are selected for admission to vocational programmes at the beginning of grade 10 on the basis of personal desire and aptitude for acquiring the skills and knowledge essential to successful performance in the chosen occupation. Most programmes terminate at the end of grade 12; some, however, are conducted as post-secondary terminal courses in grades 13 and 14.

Vocational education in agriculture is designed to meet the needs of persons over 14 years of age who are preparing for work on the farm. Training may be given in day classes in the secondary school, in young farmer classes for out-of-school youth, or in adult farmer classes. Secondary schools must provide for at least six months of directed or supervised practice in agriculture each year on a farm for all persons enrolled. The instruction deals with practical farm problems and is sufficiently flexible to adjust to the types of farming found in the community served by the programme. Instruction takes place in classrooms, laboratories, shops, and in the field. Secondary school courses last for not less than 2 years and programmes for young and adult farmers consist of not less than 10 meetings totalling at least 20 hours of group instruction per year.

Vocational education in distributive occupations is for persons over 16 years of age who are employed in such occupations, i.e., proprietors, managers or employees engaged primarily in marketing or merchandizing goods or services. Such occupations are to be found in business establishments—both retail and wholesale, and in manufacturing, storage, transport, financial and risk-bearing enterprises. The students attend classes in conjunction with their part-time employment under a co-operative school-work arrangement or during their non-working hours.

Vocational education in home economics is designed for persons over 14 years of age. The curriculum for both young people and adults is concerned with the fundamental values and problems of home life and homemaking and is designed to develop the necessary skills, understanding, attitudes, and appreciation. The time devoted to home economics classes in the secondary school varies from one-half of the total school time per week to class time equivalent to a full unit of credit for other school subjects, for not less than two years, as the local school authorities decide. The courses for young people who have left school and for adults are also given in the school under the supervision of a teacher.

Vocational education in trades and industries is designed for persons over 14 years of age who are preparing to enter a trade or take an industrial job. The programmes are intended for journeymen, technicians, and industrial workers; apprentices; and for young people whether in school or out-of-school. Instruction may also be provided for industrial supervisory personnel. In addition, courses are offered for nurses, laboratory assistants, draftsmen and technicians. In general, students who attend the secondary school are required to spend at least half the time allotted for instruction in work of a useful or productive nature. Subjects related to the occupation taught are offered and, in addition, general education subjects round out the curriculum. Classes are held in the evening and at other non-working hours for employed workers 16 years of age and over. These classes are strictly limited to giving supplementary instruction relevant to the daily employment of those enrolled. Part-time schools or classes are also conducted for employed workers and apprentices. Co-operative programmes are operated for student learners who spend an average of not less than 15 hours per week during the school year as employed workers during the normal day school hours, and an average of 15 hours per week during the year in attendance at classes.

Vocational programmes are conducted at the secondary level in schools of various types. Classes in agricultural education, home economics, and distributive education are usually given in the comprehensive high school where the curriculum in vocational education is but one of several curricula leading to the secondary school diploma. Trade and industrial courses may also be provided in the comprehensive high school. In some of the states, however, special premises are provided for these programmes in a trade, vocational or technical school, as the state and local school authorities see fit. In the larger metropolitan centres, trade and industrial courses are more likely to have their own school plant since the facilities and equipment required are generally best housed in a school plant designed specifically for this purpose.

All teachers of vocational subjects are required to complete specialized training. For example, teachers of agricultural subjects attend teacher training courses in agricultural education at the land-grant colleges and universities, and all must either be farm-bred or have had considerable farm experience as one of the qualifications for teaching this subject at the secondary level. Teachers in trade and industrial education are required to have had first-hand experience in the trade to be taught, the amount of experience required varying in the different states. One, for example, demands the satisfactory completion of an apprenticeship plus six years experience in the trade for entry to the teacher training programme. These teachers are trained either at designated higher institutions or in specialized programmes conducted by the state board of vocational education. Teachers of home economics subjects receive training at any one of numerous higher institutions designated by the states to prepare teachers of these subjects in a special curriculum developed for this purpose.

Teacher training schools

Virtually all teachers are trained in institutions of higher education. Students enrolled in 'normal training courses' attached to secondary schools were less than 1 per cent of the total number of students in training in 1958/59.

Specialized schools

The term refers to certain institutions above the junior high school level; there are not many of these schools, and they are found only in the largest cities. Some are designed for students who show exceptional ability in science, most of whom will enter institutions of higher learning to study medicine, chemistry, bacteriology, etc. Others are for those who demonstrate a marked ability in engineering and technical fields. Others again are for students who will eventually, perhaps after further training in institutions of higher learning, embark on business careers. Still other schools are for young people gifted in literature, art, or music. In certain cities there are institutions specializing in agriculture, horticulture, and such areas as landscape gardening and homemaking. Established for specific purposes, specialized high schools have the authority and also the obligation to refuse admission to any student who does not fall within the group the school is designed to serve.

There is no conflict between the educational philosophy of the specialized high school and that of the comprehensive high school. The former is a natural outcome of the varied curricula offered in secondary education and has been in existence for decades. Because of its large secondary school population, New York City has been a pioneer in the development of the specialized high school.

Out-of-class activities

An extremely important part of the educational programme in secondary schools is devoted to what are termed 'extra-curricular', or 'co-curricular', or 'student' activities. These are not necessarily 'out-of-class' activities; indeed, in a small but steadily increasing number of schools little distinction is made between class and certain extra-class activities. For example, work for the newspaper or the school annual may be done in a regular journalism class, or French club meetings may be held during the regular French class. Extra-curricular activities are developed and carried out in terms of well-formulated and worth-while educational goals and are integrated with other aspects of the school's instructional programme.

The most common of these activities are athletics, publication of the school paper and the annual yearbook,

production of school and class plays, membership in the orchestra, the band, the glee club, and in class and social organizations, cultural and special interest clubs, and student government. Among athletic activities football, basketball, baseball, and track sports are the most popular. Hockey, tennis, swimming, and golf are also played and intramural and interscholastic sports competitions are held. Students in many schools also take part in producing their own radio and television programmes. In short, there are usually activities for all interests, abilities and tastes. Students are encouraged to participate in at least one activity but are also advised not to undertake too many. Although a faculty adviser is always in charge, the students themselves assume considerable responsibility for the control, administration, and planning of their activities.

In many secondary schools, usually through the school council or a similar group, students also undertake a good deal of responsibility for certain aspects of the government of the school, such as the administration of elections of pupil office-bearers, provision of safety patrols on streets adjoining the school, regulation of student traffic in the school, supervision of playgrounds, control of conduct in the cafeteria, making policies for extra-class activities, and study hall supervision. Pupils may also participate in the administration of finances for extra-class activities; for example, pupils in the book-keeping class or other business courses share in the accounting work in connexion with the activities funds, usually under the supervision of a faculty member. Sometimes a school bank is operated by pupils taking business education courses who serve as tellers, cashiers, book-keepers and officers. Purchases made by pupils in school are paid at the school bank, i.e., dues for clubs and classes, cafeteria tickets, activity tickets, and similar items. In a few schools, pupils help to prepare the budget and make other decisions concerning the raising, management, and disbursement of activities funds. The common practice is to have each pupil organization prepare a budget which it submits to the student council for approval, after which the council prepares a composite budget for all activities and supervises the revenue raising and the expenditure of funds. Such responsibility provides excellent preparation for democratic living in the school as well as in life outside the school.

Pupils are encouraged to evaluate their own activities; sometimes this is done by pupils of an activity group, sometimes by the student council, and sometimes by the entire student body. Frequently the evaluation is made by special committees who may survey the student body by means of a questionnaire. Evaluation usually includes suggestions for improvement.

TRENDS AND PROBLEMS

In the decades before the 1950s the major problem in secondary education was the absorption of increasing numbers of pupils aged 14 to 18. During the 1950s, and increasingly during the last two years, the emphasis has shifted from this quantitative consideration to a concern for quality—popularly called 'the pursuit of excellence'—in the secondary schools. Parents and other citizens are becoming interested as never before in this question and partly as a result of increased public interest, partly because of the changing world scene, the American high school is undergoing re-examination.

Emphasis is being placed upon more fully articulating the sequence of levels of instruction, from elementary school to college. Workshops and conferences have been held for this purpose, visits have been exchanged among schools, and closer co-operation has been developed among teachers of the various age groups.

The subjects in the secondary school curriculum are being carefully examined. There is much concern over the state of science and mathematics teaching, the general opinion seeming to be that not enough pupils take these subjects in the third and fourth years, and that all science and mathematics courses need revision. Constant attention is being given to the improvement of English language instruction; the trend is to require that English be studied during all four years of the secondary school sequence. The pupils' knowledge and understanding of other peoples and cultures is being extended through the study of literature, world geography and world history, and modern languages. It is felt that more pupils should take foreign languages and that emphasis should be shifted from the acquisition of reading knowledge to ability in the spoken tongue. Aural-oral methods are tending to replace reading methods.

School systems are tending to increase the number of units of work required for graduation from high school above the prevailing 16, and also the number of courses required of all pupils in the various subject fields, especially in mathematics and science.

There has been a growing concern over the alleged neglect of gifted pupils. The definition of 'gifted' varies. In general, the term would not include more than the first quartile of all pupils tested by intelligence tests, and more frequently it is used only for the top 15 per cent. Ability grouping on the basis of IQs, reading test scores, and other measures of scholastic aptitude and competence has been more widely practiced, a form of this being the 'track' systems or 'streaming' arrangements for dividing pupils which have been adopted in a few large city systems. School-college agreements have been made and experiments carried out to enable secondary school graduates who have completed the course work in accelerated groups in the secondary schools to obtain advanced standing when they enter college. Responsibility for identifying talented pupils, advising them on the elective courses they should take in secondary schools, and encouraging them to continue with higher studies has been placed on guidance and counselling services.

During the last three years there has been a great deal of experimentation and discussion concerning the use of television in secondary school classrooms, although as yet the results are inconclusive. It seems certain that television can play an important part in instruction, but just what that part will be remains to be determined.

The problem of motivation remains one of the central problems of the whole of secondary education. It is part of the problem of the gifted, but it is also regarded as the key to a greater measure of success with the slow learners; the aim is to have all pupils learn more than they have learned in the past. The American secondary school will remain a mass education school. Improvement is being

sought along the three lines of better motivation, better methods, and an improved school curriculum.

One of the principal trends in vocational education is towards catering for older pupils than those for whom vocational courses are at present designed. This implies the extension of instruction in some institutions up to grades 13 and 14, that is, beyond the secondary school as it is usually organized. In addition, more and more employed workers are tending to avail themselves of instructional opportunities in part-time classes.

Among the many factors affecting the development of vocational education are the expansion of the population, the tendency for people in rural areas to move to metropolitan centres and seek employment in industry, the application of mechanical methods to more and more operations formerly done by hand, the development of new and improved machines with greater power and speed, the design of appliances and controls to make machines much more automatic in operation, newer methods of farming developed as a result of scientific research, and the increasing proportion of the population engaged in providing services rather than producing goods; vocational programmes will be adjusted so as to meet new and changing needs.

STATISTICS

Population (mid-year 1958 estimate): 174,064,000.
Area: 3,022,389 square miles; 7,827,976 square kilometres.
Population density: 58 per square mile; 22 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, approximately 42.6 million children and young people were enrolled in schools at all levels (not including an estimated 8 million persons enrolled in adult education courses). This represents 25 per cent of the total population. Of the total enrolment, 5 per cent were receiving pre-primary education, 67 per cent primary, 21 per cent secondary and 7 per cent higher education. The proportion of girls was between 48 and 49 per cent in primary schools, 50 per cent in secondary schools, 52 per cent in teacher training colleges and 33 per cent in universities and colleges. Women teachers were 88 per cent of the teaching staff in primary schools, including kindergarten grades, 52 per cent in secondary schools, 40 per cent in teacher training colleges and 21 per cent in universities and colleges.

Between 1953 and 1957, enrolment increased in primary schools by 17 per cent, by 26 per cent in secondary schools, by 50 per cent in teacher training colleges, and by 33 per cent in general and technical higher education. The pupil-teacher ratio in primary schools in 1957 was 33 as compared with 35 in 1953. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Table 2 gives total enrolment figures for alternate years between 1931 and 1957. There was a steady increase up to 1939, a sharp decline between 1939 and 1943, followed by another period of continued expansion up to 1957. The average total enrolment for the 1955–57 period was 43 per cent higher than the average for the 1931–33 period. Owing to fluctuations in the estimated population 15–19 years old, the secondary enrolment ratio has ranged from 50 for the 1931–33 period to 73 for the 1955–57 period.

Examination results in secondary education, 1953–57. The annual number of high school diplomas awarded from 1953 to 1957 was as follows: 1,276,100 (F.663,600) in 1953/54, 1,345,100 (F.698,900) in 1954/56, 1,414,800 (F.735,300) in 1955/56, 1,458,000 (F.757,000) in 1956/57, and 1,522,000 (F.791,000) in 1957/58. There was an increase of 19 per cent in the number of diplomas granted in 1957 as compared with 1953. The proportion of high school diplomas received by girls has remained constant at 52 per cent.

Educational finance, 1955/56. For the school year beginning in September 1955, total receipts for public education amounted to 14,544 million U.S. dollars (including debt service of approximately 216 million dollars), of which 5 per cent came from the Federal Government, 34 per cent from state governments, 54 per cent from local authorities, and the rest from tuition fees, gifts and other sources. In addition, total receipts for private primary and secondary schools were estimated at 3,753 million dollars. Total

expenditure for public schools amounted to 13,352 million dollars, and for private schools to an estimated 3,459 million dollars. The total of these amounts represented an average expenditure of 102 dollars per inhabitant. (This does not include any expenditure for higher education, public and private.) Concerning public schools only, recurring expenditure was 77 per cent of total expenditure, capital expenditure accounted for 21 per cent, and debt service (excluding higher education) about 2 per cent. (See Table 3.)

3. EDUCATIONAL FINANCE, 1955/56 (in thousand dollars)

A. RECEIPTS BY SOURCE

	Amount
Total receipts[1]	**14 544 223**
Federal Government	761 367
State governments	4 898 253
Local authorities	7 870 591
Tuition fees and other receipts from parents	218 274
Private gifts and grants	82 452
Other sources, not specified	713 286

B. EXPENDITURE BY PURPOSE

	Amount	
Total expenditure[1]		**13 352 409**
Recurring expenditure		[2]10 327 139
For central administration	524 332	
For instruction		
Salaries to teachers, etc.[3]	5 126 982	
Other instructional expenditure[3]	400 668	
Higher education[4]	666 325	
Other recurring expenditure	3 608 833	
Capital expenditure		2 809 571
Debt service, payment of interest[3]		215 699

1. Data refer to public schools only. Available data in 1955/56 for primary and secondary private schools is as follows: total receipts were estimated at $3,753,413,000, of which $232,931,000 came from the Federal Government; $29,335,000 from state governments; $2,916,000 from local authorities; $3,488,231,000 from tuition fees, other receipts from parents, private gifts and grants, and miscellaneous. Total expenditure was estimated at $3,459,241,000, including $2,796,897,000 for recurring expenditure.
2. Owing to rounding of figures details do not add to the total.
3. Not including data for higher education.
4. Includes expenditure for instruction and research in institutions of higher education.

C. RECURRING EXPENDITURE BY LEVEL AND TYPE OF EDUCATION

	Amount		Per cent
Total recurring expenditure[1]		[2]**10 327 139**	**100.0**
Central administration		524 332	5.1
Instruction		6 193 975	60.0

Higher education	666 325		6.5
Other recurring expenditure, not specified		3 608 833	34.9

For notes 1 and 2 see previous page.

ALASKA

THE EDUCATIONAL SYSTEM

Because of its great size, its long history as a territory,[1] and its minority native population, Alaska developed a complex school system.

The largest group of pupils attends schools operated by 28 incorporated school districts, each with its own school board and financed by local and state funds. For these schools, in 1957, the number of pupils enrolled in elementary schools was 19,264, of whom about 20 per cent were native Alaskans[2] and in secondary schools 4,667, of whom about 18 per cent were natives.

Next in size of enrolment come the territorial non-incorporated schools. There are 72 of these rural schools, with an enrolment in 1957 of 3,147 primary and secondary pupils. The percentages of native pupils were 48 per cent and 35 per cent respectively.

The Johnson-O'Malley schools constitute another category under territorial jurisdiction. There are 21 of these formerly federal schools, now operated by the territory in a manner similar to that for the 72 rural schools, save for the fact that the Federal Government pays the cost under the Johnson-O'Malley Act and holds the titles to the schools. The elementary school enrolment was 644 in 1957, and was practically all native. None of these schools provides secondary education.

The last group of schools under territorial jurisdiction is composed of eight schools on military bases. Though financed by the Federal Government under Section 3 of Public Law 874, these schools are operated in much the same manner as are the non-district schools. Elementary enrolment was 6,701 in 1957 and secondary, 170.

The entire territorial school system is growing at a very rapid rate; for example, the average daily attendance for 1946/47 was 7,100, and for 1955/56 it was 26,400. Annual per pupil costs rose from $233 to $439 in the same period, while the total territorial budget for education increased from $1.7 million to $11.6 million.

There are also 20–25 private and denominational schools in Alaska with an enrolment in 1957 of nearly 1,600. Most of these are elementary schools, and the enrolment is fairly evenly divided between white and native children.

A further system of schools is run in Alaska by the Bureau of Indian Affairs (BIA). This consists of 84 federal schools which enrolled 4,802 pupils in 1957. Most of these are one- or two-room, one- or two-teacher schools. In 1956/57 the smallest of these had 13 pupils, the largest 308. In 75 per cent of these schools enrolments vary from between 15 to 55. Two BIA schools call for special notice. The Wrangell Institute is an elementary boarding school with an enrolment of 255 pupils drawn from all over Alaska, some from as far as 2,000 miles away. The secondary counterpart to Wrangell is the Mount Edgecumbe High School, the only all-native high school in Alaska, which in 1957 had an enrolment of some 739 pupils. In addition to providing a thorough college preparatory programme, Mount Edgecumbe offers vocational commercial and industrial courses.

The BIA day schools are most heavily concentrated in the northern and western parts of Alaska. Along the Yukon River and the shores of the Bering and Arctic Seas schools are established in the communities which have demonstrated their permanence.

Role of public authorities. The United States Constitution provides that all powers not delegated to the Federal Government or denied to the states are reserved to the states and the people. Education falls in the latter category. Although then a territory Alaska gained authority over

1. Alaska became a state of the United States of America on 3 January 1959, but at the time this report was prepared there had been no material change in the educational system apart from the modification of the administrative apparatus mentioned below under 'Trends and problems'.
2. Native status is recognized for all persons of at least one-quarter Alaskan Indian, Aleutian, or Eskimo extraction. None of Alaska's schools is in any way segregated, though owing to geographical factors in some schools all or nearly all pupils are 'native Alaskans'.

education similar to that of a state through the Nelson Act of 1905.

The authority controlling education is the territory acting through its legislature. The Department of Education, created by the legislature to act as its agent, enjoys only such powers as are delegated to it by that body. The legislature is responsible for determining the local school organization, and local school districts exercise only specific delegated powers. In addition, the Federal Government assumes responsibility for certain aspects of education in Alaska, providing instruction to groups and in areas where federal control has proved necessary.

Non-official agencies. There are numerous non-official agencies interested in maintaining a sound educational system. Such groups as the Superintendent's Advisory Commission, the Alaska Educational Association, the Association of Alaska School Boards, and local teachers' associations are able to proffer professional advice and ideas. Other groups, such as parent-teacher associations, mothers' clubs, women's clubs, and fraternal and civic groups help develop understanding and co-operation between the school and the parents, and the school and the public.

THE DEVELOPMENT OF SECONDARY EDUCATION

Although some funds were provided by Congress after 1881, public education in fact began in 1885 with the creation of a small number of schools by the U.S. Bureau of Education of the Department of the Interior.

A Congressional Act of 27 January 1905 provided that the Governor assume the position of *ex officio* Superintendent of Public Instruction. School boards of both rural areas and incorporated towns were made directly responsible to him. This responsibility for maintaining rural schools for white children, and children of mixed extraction who had abandoned their ancestral way of life, was transferred to the territory, while the U.S. Bureau of Education retained responsibility for the education of natives and those of mixed extraction living outside incorporated towns in an aboriginal manner. The 'Alaska Fund', composed of moneys collected from various licence fees, financed the school operation.

The Organic Act of 1912 had little effect on territorial schools. The 1913 Compulsory Education Law passed by the territorial legislature proved ineffective until 1917, when funds were finally appropriated to implement the law. The Alaska Fund was supplemented by a Congressional Act of 1914 providing funds from leases of coal lands. In 1915 a further act initiated the Permanent School Fund.

The Alaska Legislature was empowered by Congress in March 1917 to organize and support the present territorial system of public education. A Uniform School Act was immediately passed which provided for a Territorial Board of Education authorized to appoint a Commissioner of Education. Provision was made for incorporation of school districts which were empowered to levy property tax for the support of schools. A system of refund from territorial funds to incorporated districts of 75 per cent to 85 per cent of certain school expenditures was established, and with certain minor changes the territorial school system emerged.

The provisions of the Alaskan Constitution clarify the territory's responsibility. 'The Legislature shall by general law establish and maintain a system of public schools open to all children of the state, and may provide for other additional institutions. Schools and institutions so established shall be free from sectarian control. No money shall be paid from public funds for the benefit of any religious or other private educational institution.'

The George-Barden Act of 1946 made available federal allocations for vocational education.

Attendance is compulsory for all children between the ages of 7 and 16 who live within one and a half miles of a school or a school transportation route.

Administration

The Alaska school system is by law administered by a Territorial Board of Education, a Territorial Commissioner of Education, and local school boards. The Territorial Board lays down policy, the Commissioner administers the public school system, and local school boards are empowered to perform all duties necessary to the maintenance and operation of schools, subject to relevant territorial laws and to Territorial Board of Education regulations.

A Textbook Commission selects and adopts a uniform set of books, which must be non-partisan and non-sectarian, for use in all branches. This commission is composed of the Commissioner of Education and six persons appointed by him with the advice and consent of the President of the Territorial Board of Education. Textbook selection is based solely on the merit of the books.

The Commissioner of Education is responsible for territorial school budgets, certification of teachers, general administration of territorial school law, contracts for school transport of pupils to centres of population, and the direct administration of rural schools. The Office of the Commissioner directly operates 72 rural schools and by contract operates schools on 8 military bases and 22 Johnson-O'Malley schools. The Department provides administrative assistance to schools operated by the Fish and Wildlife Service.

Administrative and financial responsibility for schools for native children, Indians, Eskimos, and Aleuts in some 84 localities is assumed by the Juneau Area Office, Bureau of Indian Affairs of the United States Government.

Supervision and inspection. Supervision and inspection are undertaken by the Commissioner and supervisory staff members appointed by the Territorial Board of Education. As the rural schools are directly controlled by the Commissioner of Education, they receive special attention. Supervisors also give extensive teaching help to many teachers by correspondence and by sending them books.

The Bureau of Indian Affairs supervisors inspect the schools operated by that agency.

Finance. Funds for the support of Alaskan schools are derived from the following sources: 25 per cent of the receipts of the Forest Reserves; receipts from royalties and rentals of mineral lands; 50 per cent of the receipts of the Alaska Game Commission; income from investment of the

Permanent School Fund, and the school tax. These sources provide approximately 10 per cent of the total. The other 90 per cent comes from general fund appropriations, for which the chief source of revenue is the territorial income tax. The tobacco tax, in its entirety, is earmarked for school construction.

In 1929 the basic school support law, establishing a refund system, was set up. From the funds appropriated, the Office of the Commissioner gives financial support for city schools and incorporated district schools to the extent of 75 per cent to 85 per cent of the refundable items of the budget, the percentage depending on the size of the school. On the average, the territory supports school districts to the extent of 60 per cent of their total current school expenditures.

The territory pays all costs of operation, maintenance, capital outlay, tuition, and administration for rural school systems. Transport costs for all schools, district and non-district, are borne entirely by territorial appropriations.

The Federal Government finances the schools for native children, administered by the Bureau of Indian Affairs, and the schools on military bases, operated by the Territorial Department of Education. Special schools operated by the Office of the Commissioner are supported entirely by direct territorial appropriations. Some federal funds, under Public Law 874, are made available to schools for children whose parents live or work on federal property. Also, the 1953/54 contracts covering 22 Johnson-O'Malley schools required that support on the basis of classroom units be paid by the United States Government into the territorial treasury.

The minimum salaries in both district and non-district schools are fixed by a territorial minimum salary law, which provides for periodic salary increases. The ranges of salary vary according to region ('judicial division') and the individual teacher's qualifications. In the first judicial division the salary for a beginner teacher without experience in Alaskan schools but with a minimum 3 years' training is $4,500, while a teacher with a master's degree and 12 years' experience is paid $6,900. In the second and fourth judicial divisions the minimum is $5,200 and the maximum $7,600. The third judicial division has a range of $5,900 to $8,000.

TYPES OF SECONDARY EDUCATION

The only free public institution of secondary education available to the Alaskan student is the general high school. Admission is based on the successful completion of the eighth grade in elementary school. An annual eighth grade examination is held and the diploma awarded to those who pass admits them to any high school in the territory. There are no separate educational institutions which are solely vocational or academic. Owing to demographic and geographic factors, each Alaskan high school must cater for a large area. The pupil usually attends that school which is most accessible to him.

The secondary course lasts 4 years. Each high school, to be accredited and fully approved, must offer at least 16 units in academic subjects (a 'unit' being 1 year's work in 1 subject), 6 units in practical arts, and not less than 2 units in the fine arts. The programmes offered vary with the individual high school. In general, the smaller high schools offer only one basic programme, a college preparatory programme with emphasis on academic subjects but including units in practical arts. Some of the larger high schools, under the impetus of the 1946 George-Barden Act and in recognition of the need to broaden the education programme to meet Alaska's particular problems, are offering limited programmes in vocational education. In general, full-time attendance is required.

Provision is made for 'citizenship night schools' to be established by the Commissioner of Education in any community where there is sufficient demand and when funds are provided by the legislature.

The school year begins in September on the day following Labour Day and is 180 days in length. Schools are required to operate a minimum of 172 actual school days during the school year. Normally, there are seven legal holidays: Labour Day, Thanksgiving Day (usually the last Thursday in November) and the day after, Christmas, New Year's Day, Memorial Day (30 May), and the Fourth of July. Classes meet from Monday to Friday and, according to law, each school day must not be less than 5 hours in length, exclusive of intermission.

High school courses. The Alaskan high school offers mainly college preparatory courses but limited general, pre-vocational, and vocational courses are also available in certain of the schools.

Subjects required for graduation from secondary school are English (3 units), social studies (2½), mathematics (1), science (2), physical education (½). As 16 units are needed, the student elects 7 additional units from among such subjects as typewriting, music, art, or home-making.

For subjects which require laboratory, shop, or practice sessions, such as industrial arts, home economics, office practice, biology, chemistry, physics and typing, 275 minutes per week are required, to be taught in 5 or 6 periods of 50 to 60 minutes each. For all other subjects, such as English, mathematics, general science, etc., between 225 and 275 minutes per week must be taught, in 4 or 5 class periods of 45 to 60 minutes each.

Vocational education. This is not a separate division in Alaska's schools but is integrated into the regular programme. Alaska participates in the co-operative programme of vocational education sponsored under the George-Barden Act of 1946 and receives federal matching funds for programmes in vocational agriculture, home economics, distributive education, trade and industrial education, and the fishing trades. Beginning with the adoption of an approved plan in 1946, the programme has been expanded to include in-school instruction in each of these basic areas except the fishing trade.

Vocational programmes are the responsibility of the local school board. The administrative relationship of the territory and the Federal Government to such programmes is chiefly that of ensuring that the funds appropriated are administered according to the law and that policies and procedures are being followed. The vocational programmes are developed to fit local needs. Territorial-federal funds may be used to promote and supervise guidance and counselling.

Achievement testing. Permanent records for each child are kept for official purposes and for use in diagnosis and remedial procedures. The testing programme is in the early stage of development, but eventually it will consist of an intelligence test record and at least one achievement test each year for every child. Promotion is made from class to class on the basis of teacher evaluation and sometimes through conferences with the superintendent, principal and parents.

Teaching staff. The Commissioner of Education is authorized to select qualified teachers for all territorial schools. Preference is given to bona fide Alaska residents who possess the necessary qualifications. The same selection policy is recommended to all school boards in incorporated school districts, all of which have authority to appoint the teachers for the district schools.

Secondary teacher's certificates are granted to those with a bachelor's degree or higher degree from an accredited college or university; they must also have completed at least 16 semester hours of education, including 4 semester hours in practice teaching and methods of teaching and have maintained a minimum 'C' grade average. All teachers must be United States citizens and must obtain an Alaska teacher's certificate unless they are on the exchange programme. The minimum age for teachers is 18.

TRENDS AND PROBLEMS

The education of native Alaskan children constitutes the greatest problem confronting Alaskan educators today. The last 10 years have seen a profound change in the federal policy toward Alaskan natives, as well as toward American Indians in the United States. Previous programmes of assistance were premised on the idea that the native population would remain in their own villages. Latterly, the policy of the Department of the Interior has been 'pointed toward discharging the nation's obligation to the natives to assure that as individuals and groups they maintain national standards of health, education and economic well-being. The rehabilitation of Alaska's natives and their complete assimilation into the culture and economy of Alaska is the goal of this policy and its related programmes' (Governor's Report, 1951, pp. 3–4). Recently, the Federal Government has emphasized a type of education programme which will prepare the Alaskan native to live anywhere in the territory, rather than merely in his own village.

As this policy of integrating the native population into Alaskan society has developed, the courses of study in the schools run by the territory and those of the BIA have become more alike and there has been a tendency on the part of the territory to make the programmes of study in all schools identical. While it seems desirable to preserve the native culture, it is recognized that educational opportunities should be made equal for all sections of the population.

Another problem which confronts the Alaskan educators today arises from the absence of mandatory incorporation laws. Thus several areas deemed large enough and capable both of incorporation and partial self-support have not been incorporated; rather, the areas have elected to remain under territorial jurisdiction, which means they receive full territorial support.

There is also a pressing need for more vocational and prevocational programmes. Given Alaska's economic and geographic situation, more programmes of this type are needed to give Alaskan youth the necessary training to enable them to provide for themselves and serve their community.

There is a growing teacher shortage because there are too few Alaskans in training to teach in the territory, and the supply from the United States is diminishing as salaries there increase.

The climate and terrain, the short building season, and the shipping problem all tend to complicate school construction and to make building costs excessive.

Finally, Alaska faces a tremendous growth in her school population with a resulting increase in budgetary requirements and a need for more teachers and schools.

Over the years Alaska has developed basically good schools. A continued programme of growth and expansion, and efforts to provide more and more effectively for the educational needs of the entire population, give promise that Alaskan schools will achieve a very high standard.

Alaskan education since statehood

The Constitution for the State of Alaska adopted by the people of Alaska in 1956, and approved by Congress in the Statehood Act of 30 June 1958, specifically provided that all existing laws would remain in force until amended or repealed by Alaska Legislatures. The actual implementation of several constitutional mandates, particularly those related to the development of a borough system of government, may ultimately have considerable effect on state and local organization. The 1959 session of the Alaska Legislature took no action which materially changed actual school operation, but it did modify the organization of the Department of Education.

Under the omnibus Alaska Governmental Reorganization Act all previous acts relating to the Territorial Department of Education were repealed. The new Act provides for a 6-member Board of Education appointed by the Governor for overlapping 3-year terms, subject to legislative confirmation. This board nominates a list of candidates for the position of Commissioner of Education. The Governor appoints a Commissioner from the list (or may reject a list and call for a new one) and the appointment made is then subject to legislative confirmation. (Under the territorial system the board had authority to appoint a Commissioner for a 4-year term.) The appointment is nominally for a 5-year term, although the Act provides that, notwithstanding any other provision of the Act, all department heads serve at the pleasure of the Governor. Under statehood the Commissioner, rather than the board, is the actual head of the Department and has regulatory power which is subject to board confirmation but which could be exercised independently with approval of the Governor if the board did not concur.

STATISTICS

Population (mid-year 1957 estimate): 211,000.
Area: 586,401 square miles; 1,518,775 square kilometres.
Population density: 0.4 per square mile; 0.1 per square kilometre.

Summary of school statistics, 1953–57. During the school year 1957/58 there were about 45,600 pupils enrolled at schools at all levels, representing some 20 per cent of the total population. Total enrolment was distributed as follows: pre-primary and primary education, 81 per cent; secondary education, 13 per cent; higher education, 6 per cent. Women students were 37 per cent of the total enrolment in higher education. Between 1953 and 1957 total enrolment increased by 30 per cent, enrolment in pre-primary and primary schools by 24 per cent, in secondary schools by 26 per cent. At the Liberal Arts College the 1957 enrolment was nine times that of 1953. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Average enrolment in public secondary schools for 1955–57 was almost five times that for 1930–34. (See Table 2.)

Examination results in secondary education, 1953–56. Seven hundred and fifteen certificates were granted to pupils of public schools in 1956/57, an increase of 24 per cent since 1953/54. The proportion of girls was 46 per cent in 1953/54 and 47 per cent in 1956/57.

Educational finance, 1955/56. The total receipts of public schools in the fiscal year beginning September 1955 amounted to nearly 18 million U.S. dollars. Almost half this sum came from the territorial revenue, 25 per cent from local authorities, 21 per cent from the Federal Government and the remainder from tuition fees, private gifts and grants, etc. Total expenditure was distributed as follows: recurring expenditure, 82 per cent; capital expenditure, 16 per cent; debt service, between 1 and 2 per cent. (See Table 3.)

HAWAII

THE EDUCATIONAL SYSTEM

The Department of Public Instruction for the State of Hawaii conducts modern American public schools in seven of the eight islands of Hawaii. In the school year 1958/59 there were 208 schools with an enrolment of 135,088 students in regular, institutional and technical schools; and an additional 13,930 in adult community schools held during the evenings. Regular schools include kindergartens, elementary schools (grades 1 to 6) and secondary schools (grades 7 to 12). The head office of the Department is in Honolulu (Oahu), with district offices in four of the chief islands (Hawaii, Kauai, Maui and Oahu).

Article IX of the Constitution of the State of Hawaii provides for the establishment of a state-wide system of public schools free from sectarian control, a state university, public libraries and such other educational institutions as may be deemed desirable. There must be no segregation in public educational institutions because of race, religion or ancestry; nor may public funds be appropriated for the support or benefit of any sectarian or private education institution.

Article IX further provides for a Board of Education and lays down its powers. The board appoints as its chief executive officer the Superintendent of Public Instruction.

The Revised Laws of Hawaii 1955 contain further provisions, a few of which are given below.

Section 37, among other matters, establishes the Department of Public Instruction, and authorizes it to adopt rules and regulations which, when approved by the Governor and published, have the force and effect of law.

Section 40(2) places responsibility on the Department for the control and conduct of all affairs pertaining to public instruction. The Department may establish and maintain

schools for secular instruction at such places and for such terms as in its discretion it may deem advisable and the funds at its disposal may permit. Such schools may include high schools, kindergarten schools, schools for technical instruction, boarding schools, evening as well as day schools. The Department may also maintain classes for technical and other instruction in any school where there may not be enough pupils to justify the establishment of separate schools for such purposes. The Department regulates the courses of study to be pursued in all grades of public schools and classifies them by such methods as it shall deem proper.

Section 40(3) establishes the English language as the medium of instruction in all public and private schools—provided that the Hawaiian language is taught in addition to English in all high schools.

Section 40(6) sets forth the conditions for the establishment of private schools and requires that they shall meet certain standards and comply with the provisions of the law.

Section 40(9) declares attendance at a public or private school compulsory for all children who have reached the age of at least 6 years and have not reached the age of 16 years on or before 31 December of any school year. Exemption may be granted in certain cases.

Section 40(15) requires the Department to provide for the release of any pupil in any public school from attendance at the public school for a period not to exceed 60 minutes each week during the school year, on such days and during such school hours as the Department shall designate, for the purpose of receiving religious instruction from the religious organization of his choice.

THE DEVELOPMENT OF SECONDARY EDUCATION

The first secondary schools in Hawaii were founded by missionaries. Public secondary schooling began with the establishment of Honolulu High School in 1895. A federal survey carried out in 1920 showed that only three pupils out of every 100 were enrolled in public high schools, and the Federal Commission therefore recommended increasing high school accommodation, especially in remote areas. In order to avoid the high drop out (40 per cent of the pupils failing to complete the course), the commission suggested five different curricula: arts preparatory, science preparatory, commercial, industrial and home economics. It also recommended the establishment of junior high schools (since 1932 known as intermediate schools).

At that time vocational education was practically non-existent, but in 1925 the Hawaiian legislature accepted the provisions of the federal Smith-Hughes Act,[1] and in 1927 a special board for vocational education was set up and a director of vocational education appointed.

In 1920 Hawaii's secondary curricula, following the mainland pattern, were college preparatory, commercial and general. In 1940 a broader type of programme was introduced which included art, music and dramatics. By that year two trade schools and four secondary schools with courses in trades and industries were receiving federal aid. Home economics was being offered in 59 schools, the majority of them rural secondary schools. Hawaii being primarily an agricultural community, agriculture received special prominence in the vocational education programme. In 1941 the Territorial Apprenticeship Act was passed, providing appropriate instruction for indentured apprentices in the trade and industrial education programme of the public school system.

Act 83, Session Laws of 1941, passed the Single Salary Schedule Act, under which all teachers, whether kindergarten, elementary or secondary, were paid according to the same salary scale.

In the decade following World War II there was considerable expansion in the number and variety of vocational courses, and the secondary programme of studies was revised in 1958. In the same year the Superintendent's Curriculum Council was organized so as to work out, together with representatives of the administrative and teaching staffs from all the school districts, over-all curricula for Hawaii's schools. Long range plans for several years were mapped out.

On 12 March 1959 Congress granted Hawaii statehood and with this momentous change in government Hawaii will henceforward benefit on an equal footing with other states from federal aid in health, welfare and education.

Legal basis

Some of the principal laws governing the school system as a whole, and therefore covering secondary education, have been referred to in a previous section. Further provisions specifically related to secondary education (general and vocational) include the following sections of the Revised Laws of Hawaii 1955:

Section 42(1). 'The Department . . . may include agricultural and industrial pursuits among the branches of instruction taught by the public schools.'

Section 42(2). '. . . There shall be prescribed courses in agriculture, manual training, domestic arts and domestic science in all grades above the sixth grade in all public schools where proper facilities are available, which courses shall be compulsory . . .'

Section 42(21). 'The Commissioners of Public Instruction are designated as a territorial Board for Vocational Education. The chairman of the Board of Commissioners is designated as chairman of the Board for Vocational Education; and the Superintendent of Public Instruction its administrative officer . . .'

Administration

Secondary education is offered to students in seven of the chief islands. The state programme is planned by the Instruction, Vocational and Special Services Divisions in the central office of the Department of Public Instruction. Secondary education is uniform throughout the islands and taught under a single school system. The secondary programme is planned in relation to the elementary school curriculum; certain facets of the programme are reviewed by the Superintendent. Upon approval by the Superintendent and the Commissioners of Public Instruction,

1. See chapter on United States of America, p. 1366.

policies and plans are implemented through the four district offices.

There is supervision of the Secondary Education Programme from the state office by the Superintendent, carried out through the secondary curriculum staff. At the district school offices, the superintendents of the district provide supervision through their staffs and school principals.

Financial support for the public schools of Hawai is derived from the following sources:

State of Hawaii. Biennial appropriations by the Legislature based on a budget prepared by the Department and submitted through the Governor with his recommendations for approval or modification. Approximately 88 per cent of the total cost of education comes from this state aid.

County. The local county political sub-divisions (Hawaii, Kauai, Maui and Oahu) are responsible for the acquisition of school sites, for school plant construction, maintenance and operation and, where they are provided, for school transport services. About 10 per cent of the total cost of education is a charge against county funds.

Federal. Hawaii shares on the same basis as the other states in various federal grants-in-aid for the support of education, and these cover about 2 per cent of the total cost. The main sources of federal grants are: grants in support of areas related to defence activities; the National Defense Education Act; various public laws in support of vocational education; reimbursement of expenditures for veteran training in agriculture.

At the secondary level certain course fees are charged but the Department hopes to abolish these as soon as possible.

In general, funds are distributed on the basis of pupil enrolment. Teachers' salaries are an obligation of the State Government and are provided through biennial appropriations as described above.

As regards buildings and equipment, technical school buildings are financed from the sale of state General Improvement bonds. Other public schools are a responsibility of the county authorities and are usually financed by the sale of improvement bonds, although recent legislation will modify this practice by the use of current revenues for at least a portion of replacement construction. Equipment is financed from current revenues—basic building equipment by the county authorities, educational equipment by state legislative appropriations.

The Department of Public Instruction recently adopted a school building guide entitled *Educational Specifications for the Public School Buildings in Hawaii.* Volume II of this guide deals with secondary school buildings, including furniture and equipment. State and county laws and regulations govern the planning of all new school plants in matters pertaining to construction, fire and safety, lighting and sanitation.

School welfare services. During the legislative session of 1943 the Division of Pupil Guidance was created and the responsibility for enforcement of the school attendance law was transferred from the Juvenile Court to the Department of Public Instruction.

Pupil guidance workers co-operate with the Juvenile Court, the Crime Prevention Division of the Police Department, the Division of Mental Health and other government services, as well as with private social agencies set up to help children and families in trouble. There is a well organized school lunch service.

TYPES OF SECONDARY EDUCATION

All public secondary education in Hawaii is of the comprehensive type and is available to all pupils who have completed the elementary school, from kindergarten to grades 1 to 6.

The guidance programme developed in each of the secondary schools assists pupil and parents in selecting the type or category of training desired. Secondary education is expected to provide for five categories: college preparatory, scientific; college preparatory, general; technical; business occupations; and terminal.

The types of further education open to secondary school leavers are university, or technical education for the thirteenth and fourteenth years of schooling.

The secondary school year runs from 1 September to mid-June and is organized in two semesters: September to January and February to June. The school day is of 6½ hours and the school week 5 days (Monday to Friday).

General secondary schools

The Required Programme indicates those subjects required of all secondary students regardless of their long-range educational and vocational goals. They include the language arts, social studies, mathematics, physical education, science and the practical and fine arts.

The Minimum Elective Programme indicates courses offered in every high school, regardless of size and designed to meet any one of a number of long-range educational goals, whether college preparatory, technical or terminal.

The Additional Elective Programme provides additional courses to meet the varying interests of students.

It is essential that a student be helped early in his school career to decide what kind of course he will need to take in high school to prepare him for a vocation. Since many students do not know what they wish to become, it is not always possible for them to prepare for any one vocation. However, they should be able, with guidance, to determine to some extent fields of preparation, such as scientific, mechanical, business, etc.

During the 8th grade, students are made familiar with the five categories referred to above and informed of opportunities for further education. In grade 9, each student is placed tentatively in one of the five categories, but throughout the rest of his school career (grades 9 to 12) he can be shifted if necessary into a category which more nearly meets his needs.

Grouping within the school is decided according to the individual needs of students. This means, for instance, that a class of 35 pupils in English might possibly have pupils from several categories.

The Department recommends that pupils should be provided with broad as well as specialized experiences. For example, students taking the science programme should be persuaded to take elective courses other than science—such as art, music, news-writing and others. Wherever

possible, parents are consulted in this long-range educational vocational planning.

The required programme taken by all secondary students is as follows:

Grade 7. English, social studies, mathematics, physical education (one semester), art (one semester).

Grade 8. English, social studies, mathematics, physical education, electives.

Grade 9. English, social studies, mathematics (algebra or general mathematics or high school arithmetic), physical education, health (if not taken in grade 7 or 8), practical arts (agricultural arts or general shop for boys, general homemaking for girls; students who met this requirement in the 8th grade are excused), elective.

Grade 10. English, social studies, physical education, health (may be taken in grades 10, 11 or 12), electives.

Grade 11. English, social studies, electives (maximum 4).

Grade 12. Same as grade 11.

The minimum programme from which electives may be chosen is as follows:

Applied arts. Exploratory drawing, painting and crafts.

Business education. Book-keeping 1 and 2, business arithmetic, general business, typing 1 and 2, shorthand 1 and 2.

Foreign language. Any of the language courses included in the approved list of course offerings (2 years).

Mathematics. High school arithmetic, algebra, plane geometry, solid geometry (1 semester), trigonometry (1 semester).

Music. General music, a vocal music course, an instrumental music course.

Practical arts. Industrial arts, homemaking, agriculture.

Physical education.

Science. Advanced general science, biology, chemistry, physics.

Social studies.

To achieve promotion, students in the intermediate school grades must earn four or more credits each year, a credit being obtained on the successful completion of a full year's work in a subject. At least two of these credits must be in the required subjects, and one of these must be either English or social studies. A 9th grade student in a three-year intermediate school who does not meet the above requirements may be accepted into the 10th grade by the high school on a trial basis if the principals of the intermediate and high schools concerned agree that he will benefit from high school experience. This same procedure would apply for the 9th grade in the school organized on the 8–4 basis. Students in grades 10–12 are promoted on the basis of earned credits, as set out in the Department of Public Instruction's publication, *Program of Studies for the Secondary Schools of Hawaii.*

A written report for each student is made to parents at least four times a year, at the end of each quarter, indicating the student's personal development as well as his academic progress.

Adult education. This includes general elementary and secondary education, and civic, cultural, social and recreational non-academic subjects. In the secondary field, evening classes at regular high schools are available; they have the same credit requirements as day schools, viz., English, social studies, mathematics, science. Elective are vocational and commercial subjects, foreign languages, music, art. Many non-academic courses are also available, such as parent education, leadership training, investment courses, home improvement, driver education, cooking, sewing, etc.

Teachers. The Professional Teacher's Certificate of the Department of Public Instruction is based on a five-year programme of preparation. Requirements can be met in any one of the three following ways.

1. Completion of all requirements for the Five-Year Diploma granted by the College of Education, University of Hawaii.
2. Completion of the following requirements: (a) a minimum of 30 semester credits of collegiate work subsequent to the bachelor's degree; (b) a minimum of 24 semester hours in education during the 5 years of college training —those specializing in secondary education must take adolescent psychology, principles of secondary education, and the teaching of a particular subject field (methods and materials); (c) practice teaching in addition to the 24 semester hours in education courses called for above and at the teaching level for which the teacher is to be certificated (five full years of successful classroom teaching experience certified by proper school officials may be accepted in lieu of practice teaching).
3. Completion of a total of 160 semester credits, provided all requirements in 2(b) and 2(c) above are met. In addition, for secondary certification a teacher must meet the teaching requirements for at least one subject field, including a teaching course in that field.

Teachers are recruited from the University of Hawaii's College of Education and from mainland universities at the rate of 200 secondary teachers a year, the majority from local sources. Teachers are on probation for two years and then receive permanent tenure. Retirement is optional after 25 years' service, mandatory at age 65.

Vocational and technical schools

Vocational and technical education is administered and supervised by a staff of specialists under a Division of Vocational Education, headed by a deputy superintendent who has overall responsibility for programmes in agricultural, business, homemaking and industrial arts education, for trade and industrial education, occupational information and guidance, and the school lunch service.

Agricultural education. The various courses are as follows:

Agricultural arts: Intermediate. Grades 8–9. Provides a wide variety of information and experience in agriculture on an exploratory basis immediately prior to the time when a boy makes a tentative occupational choice and plans his senior high school programme.

Agricultural arts: General. Grades 10–12. Main subjects: the propagation, care and use of plants and trees, elementary landscaping and the care of poultry and small animals.

Agricultural arts: Horticulture. Grades 10–12. Main subjects: the propagation, care and use of ornamental plants, and ornamental and fruit trees, elementary landscaping.

Vocational agriculture. Main subjects: animal science, plant science, agricultural economics and farm management, farm mechanics, marketing of farm products, soil conservation and maintaining a favourable environment for farm living. Boys who enrol in vocational agriculture participate in the Future Farmers programme and in its citizenship and leadership training activities.

Young Farmers programme. For young men 16 years of age or older, working on their farms or employed in agriculture. Minimum of 30 clock hours of organized evening class instruction during the year.

Elementary gardening (agricultural science). Grades 4, 5 and 6, 90 minutes per week. Encourages careful observation, exploration, and experimentation in activities pertaining to gardening.

Business education. Business subjects offered in Hawaii's secondary schools include: book-keeping, business arithmetic, business English, business law, clerical practice, co-operative office training, co-operative retail training, economics, general business, machine calculation, office machines, office practice, salesmanship, shorthand, store service, typing and typography.

In the larger high schools where business course offerings are more extensive and more highly specialized, students may follow one of four sequences: stenography, book-keeping, clerical training, and retailing or distributive trades. Students who demonstrate high vocational competency may acquire work experience through the co-operative retail training and the co-operative office training courses. In 1958, 168 firms employed 171 co-operative retailing and office training students, the gross earnings of the latter totalling $100,272 or an average of $586 per student.

Homemaking education. This includes child care and development, family and community relations, family economics, clothing, family health, food and nutrition, housing and home equipment and furnishing. The individual problems studied are related to the needs, interest and abilities of the individuals served.

A basic 2-year curriculum, covering all areas of homemaking is offered—the first year course at either the 8th or 9th grade level and the second in grades 10–12. For practical work the school is usually equipped with one 'all-purpose' room with an attractive homelike atmosphere.

Students in advanced classes study homemaking with emphasis on planning for their future families. Family economics, family health and home management are stressed. 'Home experiences', providing learning experiences which cannot easily be duplicated in the classroom, are an important part of the homemaking programme.

The Future Homemakers of America, a national organigramme of activities supplementing class work and offers zation of girls enrolled in homemaking classes, has a pro- opportunities and training in leadership.

Industrial arts education. Students are given an opportunity for the study of man and industry through experience of industrial processes and techniques. Industrial arts education enriches other programmes such as mathematics, science and language arts by bringing theory and practice closer together.

Industrial arts is a required programme in the 8th or 9th grades with an introductory exploratory course called general shop, including mechanical drawing, woodwork, metalwork, plastics and electricity. Elective courses in the 10th, 11th and 12th grades include auto mechanics, electricity and radio, general metals, mechanical drawing and architectural draughting, printing, and woodwork.

Trade and industrial education. Hawaii's technical schools, operated by the Vocational Division, were established in 1925 when the Smith-Hughes Act was extended to Hawaii. The trade and industrial education programme, provided in five technical schools, gives pre-employment training in aircraft mechanics (airframe and powerplant), auto body repair and painting, auto mechanics, business education (accounting, clerk-typist and secretarial science) cafeteria management, carpentry and cabinet-making, commercial baking, commercial sewing, cosmetology, diesel mechanics, drafting, building trades, electricity, electronics, engineering aid, hotel and restaurant cooking, hotel room girl and room boy training, machine shop, garment power machine operation, practical nursing, refrigeration and air conditioning, sheet metal working, waiter and waitress training, welding.

These technical schools are an integral part of the public school system of Hawaii, organized and maintained to provide preparatory training for specialized occupations. Instruction is geared to the requirements of business and industry. The workshops and laboratories have up-to-date tools and equipment and the students are given intensive practical training.

Upon completion of a unit course at any of the technical schools, a student is qualified to enter directly into the occupation for which he was trained or may take further training by indenture as an apprentice in certain trades.

The trade and industrial education service supervises and evaluates programmes offered, purchases supplies and equipment, selects and places new teachers, plans long-term goals, carries on teacher training in conjunction with the University of Hawaii, plans for and participates in research projects, supervises the evening programme, promotes training for industry as needed, acts as an *ex officio* member of the Territorial Apprenticeship Council and works with other agencies in the development of new programmes.

Occupational information and guidance service. This service, under the Department of Public Instruction, seeks to promote and develop effective educational-vocational guidance programmes in the public secondary schools of Hawaii. The objective is to help students discover, use and develop natural abilities so that they may live and make a living to the best advantage of themselves and of society. As a basis for effective counselling and guidance, data are collected on family background, physical well-being, personal adjustment, general academic ability, achievement in curricular and non-curricular activities, interests, aptitudes and occupational experiences. Besides specific classroom study units, occupational information is provided through library reference shelves on vocations, bulletin board displays, excursions to local businesses and industries, outside speakers for assemblies and career programmes, audio-visual aids, career clubs and related activities.

Following the choice of an appropriate occupational goal toward which to work and study, each student is encouraged to develop a long-range educational-vocational plan with the assistance of his teacher-counsellor. These plans take into account not only the school subjects needed but also desirable extra-curricular activities, work experiences and leisure-time activities. The approval of the parents is required in addition to that of the school authorities. The complete guidance programme includes periodic follow-up contacts with former students to provide a guide for curriculum adjustments and to enable the school to continue to help former students with adult education services.

Other specialized schools

The Honolulu Academy of Arts, a private art centre and museum in Honololu, conducts a full-time art school, founded in 1947. Subjects taught include basic and advanced drawing and painting, design and commercial art, landscape, portrait, flower and Chinese brush painting, basic and advanced sculpture. The art school offers a 2-year course of study, with a third year of 'technical studies' available for advanced students. Part and full-time scholarship funds are available.

The Punahou Music School, begun in 1919, offers a programme of special study in music and dancing.

Out-of-class activities

Both public and private secondary students participate widely in out-of-class activities. All have student governments and many social activities are enjoyed, including school dances, picnics, excursions and athletic meetings, and a great variety of school sports and games. School clubs include science, language, photography, literary and dramatic clubs, Future Teachers, Future Farmers, Future Homemakers, Future Business Leaders of America, Young Farmers, Newman Clubs, Christian Clubs, etc.

TRENDS AND PROBLEMS

General education. One of the main concerns of the educational authorities in Hawaii is to provide an appropriate programme for the broad spectrum of abilities found in the usual school-age population. For this reason, the Department of Public Instruction has divided its curricula into the subject areas described above. These are generalized fields, and students are not kept rigidly within their limits; a minimum set of electives is provided—or at least attempted—in all the schools. In addition there is a common general education programme required of all students, regardless of their long-range educational and vocational goals.

The inability of Hawaii's high schools to offer as broad a programme as the authorities would like is partly due to the fact that the pupil-teacher ratio is the same for both elementary and secondary schools. In the smaller schools, primarily in rural areas, it is impossible to have a sufficiently numerous teaching staff to provide a wide range of subjects. The only solution would be to treat the high schools on a totally different basis from the rest of the educational programme as regards pupil-teacher ratio, administrative and supervisory support, guidance facilities and student extra-curricular supervision and control. Unfortunately, this has become a matter for contention between the two groups of educators—elementary school and high school.

Of increasing concern to the educational authorities is the improvement of science, mathematics and foreign language courses. Renewed efforts in this sense are being made through the appointment of additional educational consultants and the use of National Defense Education Act funds. Unfortunately, these funds are inadequate and additional money will have to be raised locally.

Another matter receiving increased attention is the education of exceptionally gifted young people. Much is being done through the use of 'honours programmes' and through accelerated classes which provide instruction in mathematics, science, and literature at college level.

Vocational education. A fundamental shift in the character of Hawaii's economy has brought about a transition from an economy devoted primarily to commodity production (agriculture) to one in which service industries are now the most important element. Moreover, the integration of the Hawaiian economy into the national economy is now proceeding at a more rapid pace; each year an increasing number of high school graduates go to the mainland to continue schooling or enter employment. Particular attention therefore needs to be given by vocational education to providing more training opportunities not only for students entering local employment but for those who seek employment in mainland communities.

Of those who graduate from secondary schools, approximately 50 per cent seek education beyond high school before entering employment. This trend will require greater emphasis on specific vocational training at the post-high school level. In the skilled occupations a new level of employee, called a technician, is increasing in importance. American industry indicates that five technicians are needed for every one graduate engineer. To meet this growing need, new vocational training programmes in such subjects as communications and electronics technology have been developed for selected vocational students at the post-high school level.

It is estimated that the total population of Hawaii will increase in 20 years by 200,000. The great increase in the number of young people requiring employment after graduation from secondary school will necessitate an expansion of vocational courses.

[*Text prepared by the U.S. Office of Education, Department of Health, Education and Welfare, Washington, D.C., in June 1959.*]

BIBLIOGRAPHY

HAWAII. DEPARTMENT OF PUBLIC INSTRUCTION. *Annual report.* Honolulu.

——. GOVERNOR. *Annual report of the Governor of Hawaii to the Secretary of the Interior.* Washington, D.C., Government Printing Office.

STATISTICS

Population (mid-year 1957 estimate): 613,000.
Area: 6,423 square miles; 16,636 square kilometres.
Population density: 95 per square mile; 37 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment of pupils at all levels of education was estimated at 170,000, or about 28 per cent of the total population. About half the total enrolment was in primary grades 1–6; higher education accounted for about 5 per cent. Between 1953 and 1957, the increase in enrolment was about 8 per cent. (See Table 2.)

Enrolment trends in secondary education, 1930–57. Table 1 shows that the average enrolment in general secondary schools, grades 9–12, public schools only, was two and a half times higher in the 1945–49 period than in the period 1930–34. For the periods since 1950, enrolment figures refer to grades 7–12 in both public and private schools; thus the average number of pupils exceeds the estimated population 15–19 years old.

Examination results in secondary education, 1953–57. The total number of secondary school graduates was as follows: 1953/54, 4,775 (F. 2,458); 1955/56, 5,233 (F. 2,604); 1957/58, 5,434 (F. 2,683).

Educational finance, 1955/56. For the school year beginning in September 1955, total expenditure for public schools, not including higher education, amounted to 39 million U.S. dollars, or an average of $70 per inhabitant. Recurring expenditure was 86 per cent of the total. (See Table 3.)

PANAMA CANAL ZONE

THE EDUCATIONAL SYSTEM

The basic authority under which public educational facilities are provided in the Canal Zone is Section 5 of Title 2 of the Canal Zone Code. There is no body of school laws, the school system being governed by administrative regulations.

The United States Congress initially appropriates funds for the entire cost of the Canal Zone Government, including its educational programme. Amounts expended by the Canal Zone Government for the provision of education to employees of agencies of the United States and their dependents, other than the Panama Canal Company and the Canal Zone Government, less tuition fees paid by such employees and their dependents, are repaid to the Canal Zone Government by such agencies.

Tuition fees received by the Canal Zone Government and the amounts paid by other government agencies are deposited in the United States Treasury. The difference between the total of these amounts and the total cost of operating the schools is repaid to the Treasury by the Panama Canal Company, which is required by law to reimburse the Treasury, as nearly as possible, for the net difference between the appropriation for the Canal Zone Government and the receipts for its services.

Appropriations of Congress cover salaries of teachers and other staff members, costs of school buildings, classroom equipment, library and textbooks, and certain other school supplies.

There is no subsidization or subvention of private education.

Non-resident children who are not dependents of United States citizens in United States Government employment are charged tuition fees.

The Canal Zone public schools are administered under the immediate supervision of the Superintendent of Schools, subject to the general direction of the Civil Affairs Director of the Canal Zone Government.

School physicians and nurses are provided by the Health

Bureau of the Canal Zone Government, which is also responsible for the inspection of sanitation. The school health programme is jointly supervised by the Superintendent of Schools and the Health Director.

School buildings are inspected annually by the Maintenance Division of the Panama Canal Company.

Structure of the school system. The educational ladder comprises elementary schools, consisting of a kindergarten class for 5-year-olds followed by grades 1 to 6, six years' secondary education (grades 7 to 12) and junior college (grades 13 and 14). Separate schools are provided for children of United States citizens and for the children of citizens of the Republic of Panama who live in the Canal Zone. What are known as United States schools and Latin American schools differ mainly in that the former are conducted in English with Spanish as second language, and the latter in Spanish with English as second language; the former follow the general pattern of schools in the United States, and the latter the pattern of those in the Republic of Panama. These differences are maintained so that the children will be properly prepared to take their place in their respective countries.

School attendance is not compulsory at any grade level in the Canal Zone but represents a high percentage of children of appropriate age (over 95 per cent in grades 1 to 6).

THE DEVELOPMENT OF SECONDARY EDUCATION

The United States of America secured control of the Panama Canal Zone in 1904 and in September of that year the Isthmian Canal Commission authorized the establishment of a school system. The first public school was opened on 2 January 1906 and a limited number of secondary classes were organized in 1907. In 1909 the first four-year high school was established. The Canal Zone Junior College was opened in 1933. In 1954 the language of instruction in schools for the children of residents other than United States citizens was changed from English to Spanish. A recent development in secondary education has been the establishment of 'advanced achievement classes' for the brighter students.

Administration. Secondary education is organized, administered and controlled by the Division of Schools.

The Superintendent of Schools is assisted in the supervision of public secondary schools by the following officials: an assistant superintendent; an assistant to the superintendent in general charge of secondary education; a supervisor of instruction in charge of classroom supervision, materials of instruction, and curricular development in the Latin American schools; a supervisor of Spanish in charge of the Spanish language programme in the Latin American schools and of Spanish as a secondary language in the United States schools; a supervisor of physical education and athletics in both United States and Latin American schools; supervisors of music.

All members of the supervisory staff are required to hold a master's degree, to have had training in the field of specialization and appropriate experience, and to possess the necessary aptitude. They are appointed by the Superintendent of Schools with the concurrence of the Civil Affairs Director.

There is only one private secondary school; it is recognized by the Canal Zone Government but is not directly supervised by the Superintendent of Schools nor does it receive any support from public funds.

TYPES OF SECONDARY EDUCATION

As already mentioned, the secondary course lasts 6 years and covers grades 7 to 12. It is divided into junior and senior stages: 2 + 4 in United States schools; 3 + 3 in Latin American schools.

Secondary schools in the Canal Zone provide courses in general education, commercial education and, to a limited extent, in vocational training. There are special classes for handicapped children but no special schools as such. Curriculum and methodology in the secondary schools for United States citizens follow the general pattern of schools in the continental United States. In the Latin American secondary schools practices are, in general, those of public schools of the Republic of Panama. Teachers are given considerable leeway in the use of their own methods.

The school year runs from the beginning of May to the beginning of February. Additional vacations are taken in September and at Christmas and public holidays are also observed.

Promotions or retentions are made at the end of the school year after evaluation by teachers and principals of the child's record. Special end-of-year tests help to determine final grades. Educational, physical, and medical records are kept which follow the child from grade to grade and from school to school, and which are used extensively by teachers for diagnosis and remedial work. Reports are made to parents at the end of each 6-week period.

Teaching staff. In the United States schools, secondary teachers for grades 7 and 8 must have a bachelor's degree from a recognized college or university in the United States with not less than 15 semester hours of professional courses, must be 21 years of age, and have specialized in the field in which application is made. Teachers in grades 9 to 12, and principals, must have a master's degree in addition to the other qualifications.

The minimum qualification for Latin American teachers, grades 7 to 12, is a bachelor's degree from the University of Panama or an equivalent school.

Teachers and principals are appointed by the Superintendent of Schools with the concurrence of the Civil Affairs Director.

Teachers in the United States schools are protected by United States Civil Service regulations; those in the Latin American schools by related Panama Canal Company-Canal Zone Government regulations. All teachers have tenure after a year's probation, are eligible for pensions, and utilize the health services provided by the Canal Zone Government.

STATISTICS

Population (mid-year 1958 estimate): 57,000.
Area: 553 square miles; 1,432 square kilometres.
Population density: 103 per square mile; 40 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58, total full-time enrolment was 11,500, representing 20 per cent of the total population. Although from 1953 to 1957 total enrolment increased by only 2 per cent, enrolment in junior and senior high schools increased by 21 per cent and in vocational schools by 23 per cent. Combined enrolment in junior and senior high schools and in vocational schools increased from 30 per cent of total enrolment in 1953/54 to 36 per cent in 1957/58. The number of girl pupils cannot be determined accurately; it may be said to be about half of total enrolment in primary and general secondary schools. The pupil-teacher ratio in primary schools was 35 in both 1953/54 and 1957/58. In 1953/54, and 1954/55, more than three-fourths of the primary school teaching staff and about half of the secondary staff were women. (See Table 2.)

Enrolment trends in secondary education, 1930–57. From 1930–34 to 1955–57, average yearly enrolment in general secondary schools increased from 900 to 2,300 pupils. During the period concerned, the secondary enrolment ratio doubled, rising from 23 for 1930–34 to 46 for 1955–57. (See Table 1.)

Examination results in secondary education, 1953–57. The number of secondary education certificates awarded was 349 in 1953/54 (165 to girls) and 440 in 1957/58 (210 to girls).

Thus the number of certificates increased by 26 per cent whereas, during the same period of time, secondary school enrolment increased by only 21 per cent.

Educational finance, 1955/56. During the fiscal year beginning in September 1955 about 3 million dollars were spent on public schools. Of this total, recurring expenditure represented about 94 per cent and capital expenditure 6 per cent. (See Table 3.)

PUERTO RICO

THE EDUCATIONAL SYSTEM

The public educational system of Puerto Rico was created pursuant to the School Law of 31 January 1901, which provided for the establishment and maintenance of a system of free public schools under a Commissioner of Education appointed by the President of the United States of America and directly responsible to him.

The Constitution of the Commonwealth of Puerto Rico, which took effect on 25 July 1952, provides for a system of free and entirely non-sectarian public education. In the primary grades education is compulsory to the extent permitted by the facilities of the Commonwealth. Free secondary education is among the constitutional rights of all Puerto Rican children.

The Secretary of Education, as the director of the school system is now called, is appointed by the Governor of the Commonwealth of Puerto Rico with the advice and consent of the Senate. He still enjoys most of his former powers, but is subject to such laws as the Commonwealth Legislative Assembly may adopt from time to time regarding schools.

Factors affecting the provision of education. Puerto Rico was a colony of Spain from the time of its discovery by Christopher Columbus at the end of the fifteenth century until 1898 when it was ceded to the United States as a result of the Spanish-American War. All but a small proportion of its inhabitants are of Spanish origin and possess the language, culture, feelings, and attitudes of Spain, modified by tropical conditions and more than half a century of close ties with the United States. Other sources of the present population may be traced to the native Indians who inhabited the island before its discovery, the African negro slaves who were brought in by the Spanish settlers, and minor groups from other countries.

The population of Puerto Rico has grown by leaps and

bounds since 1900. Although there are indications that the curve of population growth is tapering off, a continued high rate of increase is to be expected for some years. The island, whose natural resources are extremely limited, has more than 600 inhabitants per square mile and over-population constitutes one of its most critical problems. A little over a decade ago, the Commonwealth Government launched an industrialization programme known as 'Operation Bootstrap'. Some 500 new factories have been established which have brought about a rapid rise in the average family income and have produced marked changes in the socio-economic structure and the living patterns of the island. The people are adjusting themselves to new conditions, developing new insights, and facing new problems. With the wider scope for economic and political action that it now has, Puerto Rico is tackling its problems with determination.

Role of public authorities. Prior to 1946–47, the municipal governments participated with the island government in the support of public education. This constituted a continuous drain on their meagre resources, and sometimes the municipalities were not able to meet their ordinary needs. In view of this situation, the Legislative Assembly of Puerto Rico in 1947 declared education to be the concern of the central authorities, and since then the cost of all educational services throughout the country has been borne by the Commonwealth Government.

Role of private agencies and other government agencies. In accordance with Law No. 2 of 22 August 1958, private schools may be accredited by the Secretary of Education provided that they comply with the rules and regulations laid down by him for this purpose. There are 112 accredited private schools and 9 special schools under the jurisdiction of government agencies other than the Department of Education, with a total enrolment of 55,729 pupils. The number of junior and senior high school students attending these schools is 19,693.

THE DEVELOPMENT OF SECONDARY EDUCATION

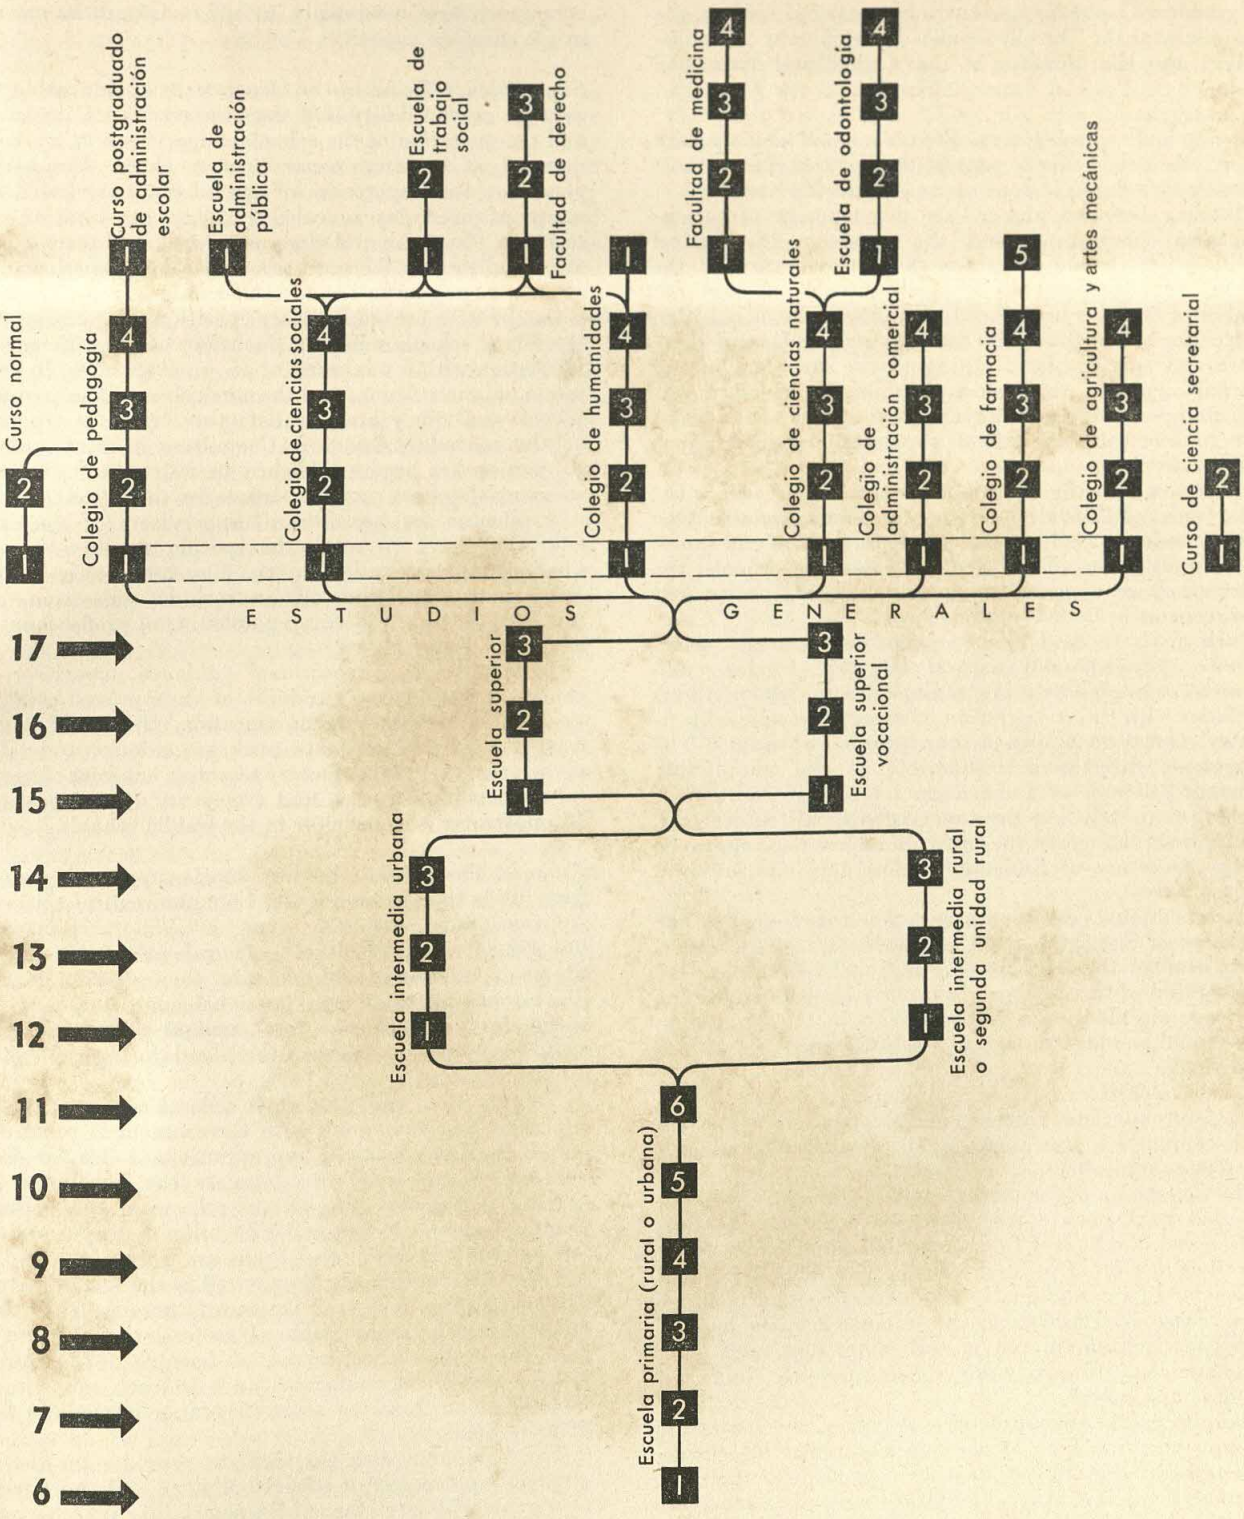
The Puerto Rican high school during the first three decades of the present century was the same as the traditional high school in the United States, and was based on the completion of the 8-year elementary school or its equivalent. The programme of studies was organized around the traditional subjects of the American high school curriculum and was offered in two types of school: high schools and continuation schools.

On 31 March 1931 the Congress of the United States made federal aid for vocational education available to Puerto Rico. The Commonwealth Legislature has consistently voted funds to match federal appropriations made under the Smith-Hughes and George-Barden Acts and the vocational education programme has grown uninterruptedly during the last two decades.

The Occupational Information and Guidance Service was introduced in 1939 and developed rapidly. The guidance programme received additional impetus after the adoption of Law No. 414 of 23 April 1946, which provided for the creation of the post of Teacher Adviser in Vocational Guidance, as a means of increasing the efficiency of the vocational schools. Further help has been afforded by the appropriation of funds for testing and counselling services under the National Defense Education Act of 1958.

In 1942 the educational system was reorganized. The junior high school was created and the 6-3-3 plan adopted in lieu of the traditional 8-4 organization.

Administration



The public school system is a moderately centralized organization and the Secretary of Education is the source of all educational policy.

In the school districts the superintendent of schools is responsible for executing the major policies and plans of the Department, as well as for planning the local educational programme. District officers and individual teachers are encouraged to adapt Central Office proposals to suit local conditions.

Policies for the development of the vocational education programme are established by the Commonwealth Board for Vocational Education. The Secretary of Education, as the executive officer of this board, is responsible for carrying out its policies and the provisions of the Acts of Congress relative to vocational education. The other members of the Commonwealth Board are the Secretary

GLOSSARY

colegio de administración comercial: college preparing for administrative careers in business.
colegio de agricultura y artes mecánicas: agricultural and engineering college.
colegio de ciencias naturales: natural science college.
colegio de ciencias sociales: college of sociology.
colegio de farmacia: college of pharmacy.
colegio de humanidades: liberal arts college.
colegio de pedagogía: teacher training college.
curso de ciencia secretarial: course of secretarial training.
curso normal: teacher training course.
curso postgraduado de administración escolar: post-graduate course in school administration.
escuela de administración pública: graduate school of public administration.
escuela de odontología: school of dentistry.
escuela de trabajo social: graduate school of social welfare.
escuela intermedia rural o segunda unidad rural: rural lower general secondary school (known as a 'second unit school').
escuela intermedia urbana: urban lower general secondary school.
escuela primaria (rural o urbana): primary school (rural or urban).
escuela superior: upper general secondary school.
escuela superior vocacional: upper vocational secondary school.
estudios generales: course of general education given in the first year of study at post-secondary institutions.
facultad de derecho: faculty of law.
facultad de medicina: faculty of medicine.

of Agriculture and Commerce, the Secretary of Labour, the Administrator of the Economic Development Administration, and the Director of the Agricultural Extension Service.

Planning and control. Puerto Rico is a small country with a relatively homogeneous population. For this reason, most planning for schools is done on an island-wide basis.

Planning has two phases: the development of the instructional programme and the provision of physical facilities. The latter comprises the determination of the number of classrooms to be built every year and the number of teachers necessary to man them, the acquisition of sites for school buildings and the preparation of blueprints and specifications. Owing to the large amount of internal migration that takes place on the island, it has been found expedient to have a local census taken every year to ascertain the school population in the various communities.

There is a Director of Curriculum and Supervision in the Department of Education and two assistant directors. One of these assistants is in charge of administration and supervision in all grades of primary and secondary schools; the other has been assigned to curriculum development and improvement in both types of schools.

Each of the several major subject departments—social sciences, physical and natural sciences, English, and Spanish—is headed by a programme director who performs his duties with the co-operation of supervisors and subject-matter specialists known as curriculum technicians. The programme director is responsible to the appropriate Assistant Director of Curriculum for the preparation of teaching materials and the supervision of his subject. All fundamental changes in the curriculum have to be approved by the Secretary of Education before they are put into effect.

The vocational education programme is prepared by the Secretary of Education with the assistance of the supervisory staff of the Division of Vocational Education. One of the duties of the director of that division is to advise the Secretary on changes or readjustments in the curriculum that should be made to keep abreast of progress in modern technology.

Local committees have been organized to represent the different occupational interests of the community and these local committees are represented on a Commonwealth advisory committee.

The selection, development, and use of basic printed materials have been entrusted to the Office for the Production and Purchase of Textbooks. Books and manuscripts, as well as any other printed teaching materials to be used in the schools, are examined by this office. Recommendations for purchase or revision must be submitted to the head of the Department for approval. All major purchases must be channelled through the Commonwealth Office of Purchase and Supply.

Planning in the school districts is carried out under the direction and guidance of the superintendent of schools. Committees made up of teachers, principals, assistant superintendents, and other supervisory personnel participate with the superintendent in a supervisory council. Officials from the Central Office and outstanding citizens in the community are occasionally invited to attend the meetings in an advisory capacity.

Supervision. Officials of the Department of Education have over-all responsibility for the supervision of instruction and the operation of the schools. Supervision as a whole is directed at the improvement of teaching. Emphasis is placed on the importance of careful planning based on a study of needs as revealed through consultation with teachers, observation of classroom work, and tests. It aims at capitalizing on the teacher's ability and experience, and at encouraging initiative and self-reliance.

Candidates for supervisory positions in the general secondary schools must be Bachelors of Arts, Science, or Education with a minimum of 15 semester hours in supervision, administration, and the curriculum of the secondary school, and two years of satisfactory teaching experience at the secondary level. A Committee of Standards for Promotion has been established to assist the Secretary in selecting the most capable persons for these positions.

Applicants for positions as supervisors of vocational education have to meet the specific requirements and qualifications prescribed in the Commonwealth Plan for Vocational Education. These include possession of a university degree and varying amounts of professional and educational experience.

To qualify as a vocational guidance supervisor, the candidate should be a graduate of an approved college or university with training in education. He should have at least one year of graduate work in guidance and related areas, two years of satisfactory teaching, one year of successful counselling services, and two years' experience as an administrator or supervisor in the public schools.

Finance. The public school system is supported primarily from funds appropriated by the Commonwealth Legislature. Appropriations for the year 1957/58 amounted to $60,438,345. The Federal Government of the United States of America provides help for the operation of school lunch-room programmes, vocational education, and education for veterans. The total amount of federal money spent in public education on the island during 1957/58 was $9,883,324.

In order to be able to receive federal aid for vocational education, the Commonwealth Government is required to match the Congressional appropriations dollar for dollar. Schools are not reimbursed unless the vocational programme is handled through the officers of the Commonwealth Board for Vocational Education and the conditions for federal disbursement of funds are fully met.

Funds are not directly distributed to the school districts. The needs of each district are met in accordance with the financial resources available. However, the Secretary of Education, under Section 6A of Law No. 472 approved 15 May 1947, may allocate funds to each municipality, including San Juan, to meet the minor immediate needs of the schools.

The Commonwealth Government provides for the construction and repair of school buildings and the purchase and repair of equipment. Responsibility for the actual construction and major repairs of existing plant facilities rests with the Department of Public Works. The Division

of School Facilities Planning advises the Secretary on building plans and co-ordinates the efforts of both departments.

The municipalities have been vested with authority to negotiate loans to construct buildings for the exclusive purpose of replacing premises rented for school use. The buildings so constructed will be ceded to the Commonwealth Government on a rental basis, and will become the property of the Government when their cost and the loans negotiated for their erection have been paid. The needs of the schools regarding equipment and other supplies are also met from Commonwealth funds.

Salaries of all duly certificated public school teachers are paid in accordance with the schedule fixed by Law No. 19 of 22 June 1956. Teachers start with a minimum of $150 a month and yearly increments of $5 up to a maximum of $210. Provisional teachers have a starting salary of $130 and yearly $5 increases until the maximum rate of $190 has been reached. Additional amounts are payable to teachers who hold university degrees, to English teachers who undertake studies in English-language countries, and in respect of teaching experience.

The salaries of vocational teachers are fixed by the Commonwealth Board for Vocational Education. In no case are these salaries lower than those established for academic teachers by the Commonwealth Compensation Law.

Buildings and equipment. Under present standards, junior high school buildings should be able to accommodate not less than 300 pupils and not more than 1,200. The maximum walking distance between the pupils' homes and the school should be one and a half miles. Senior high school buildings should hold from 300 to 500 students. The minimum size of sites for both junior and senior high school buildings varies according to the number of rooms and floors. Classrooms should have a floor area of at least 621 square feet. Rooms for home economics, industrial arts, and physical education should be 1,008 square feet in area. The school luncheon-room should be large enough to house 60 per cent of the school enrolment. There are also standard requirements for offices, storage space, lighting, ventilation, sanitation facilities, etc. No standards for equipment have been established as yet, but recommendations to this effect have already been submitted.

Social welfare services. The principal welfare services are transportation, hot lunches, shoes, scholarships, and rehabilitation. Transportation includes school bus services in several districts and direct payment to needy students to enable them to attend area trade schools located at a considerable distance from their homes. The School Lunchroom Division of the Department of Education is supplied with funds by the Federal and Commonwealth Governments, and has been authorized to accept donations of property, funds, foodstuffs, equipment, and materials. A fund of $200,000 annually has been created for the purchase of shoes to be distributed among needy students in all types of schools. A total of 185,166 pairs of shoes have been distributed since 1955/56. The Commonwealth Legislature has created a special scholarship fund for financially dependent public school pupils who are proficient in their studies.

TYPES OF SECONDARY EDUCATION

There are five main types of secondary schools in Puerto Rico: (a) the second unit or rural junior high school; (b) the rural senior high school; (c) the urban junior high school; (d) the urban senior high school, and (e) the vocational high school. Other types of schools offering high school education are the evening high school and the summer high school.

Counselling services have been instituted to help pupils in choosing the type of secondary education best suited to their needs and abilities, and in formulating their educational and vocational plans.

Students graduating from high schools may go on to college or enter employment. A follow-up study of 8,328 high school graduates from the 1957 class revealed that 3,748 entered college and 3,005 are gainfully employed.

During the 1958/59 school year more than 200 students were granted scholarships to pursue advanced studies in local and foreign universities. The sum of $235,000 is set aside every year for this purpose. Scholarships are awarded to students of poor families who are interested in doing advanced work in the fields of medicine, agronomy, engineering, architecture, art, diplomacy, music, and many other professions.

Technical courses are available at the Miguel Such Metropolitan Vocational High School, Rio Piedras, to train high school graduates for positions as technicians or engineering assistants.

The Itinerant Teachers of Young and Adult Farmers' Program is another opportunity available to high school graduates. Emphasis is given in this programme to the intelligent and effective use of those farm resources that may bring about a rise in the income of farmers.

All schools begin on the first Monday in August and close at the end of May. The school year is divided into two semesters, the second beginning after Christmas. The school week consists of five working days, Monday to Friday. There is a two-week vacation at Christmas and one week at Easter. Secondary schools are organized in one of two ways: (a) single session, with a school day of 360 minutes; and (b) interlocking, in which classes are held for two different groups of pupils by different teachers during a 300-minute session each.

June is known as 'Activity Month'. During this month no actual classroom teaching takes place. Teachers devote their time to attending summer school, travelling, preparing teaching materials and tests, and in other similar activities. July is a vacation month.

General secondary schools

Secondary education in Puerto Rico seeks to continue the cultural development begun in the elementary school, to prepare for higher education students who are interested in continuing at that level, and also to provide for those students who will take up a vocation on leaving high school. The aim of the general secondary school is to give all pupils a body of knowledge and experience that will help them to meet the common needs of all citizens, providing for individual differences through the exploration of abilities and interests.

Junior and senior high schools. The basis for admission to junior high school is graduation from the 6-year elementary school. Admission may also be obtained by means of examination or certificate granted by the Division of Free Studies and Examinations of the Department of Education.

The curriculum in the secondary schools is organized around five major areas or fields: sciences, mathematics, social studies, English and Spanish. Other subjects include music, art, industrial arts, physical education and health education.

General science and general mathematics are offered as full-year courses in the junior high school. The sciences in the senior high school are biology, chemistry, physics, and physical sciences, only one of which is required for graduation.

The social studies courses in grades 7, 8 and 9 are concerned with the geography, history and general problems of the world with special emphasis on those of Puerto Rico. The senior high school courses deal with the development of the United States as a nation, world problems, the development of culture by ages or movements, and the interdependence of Puerto Rico and other countries of the world.

Industrial arts is a course offered both for its cultural value and as a pre-vocational subject. It does not aim to develop experts in any of the various areas covered by the programme but rather to provide the student with a certain amount of experience of the various trades and professions related to industry, e.g., woodwork, metalwork, general electricity, graphic arts, general crafts, planning and drawing, communication and transport.

Industrial arts is a required subject in grades 8 and 9. Each course covers the fundamental skills of the area or occupational field as well as related information, including planning, social and economic implications of industry, guidance, science, health, safety, and consumer information. Class periods vary from 75 minutes in schools under the interlocking system to 85 in schools operating on a full-day programme.

Industrial arts is offered in the senior high school curriculum as an elective course to students who want to broaden their general culture and those who are thinking of entering industry. This course is organized to provide mechanical skills useful in the home and a knowledge of crafts and general graphic arts. Classes meet for two 100-minute periods a week or for five 50-minute periods a week.

Some industrial arts teachers are in charge of a work-experience programme. Under their guidance, students are given an opportunity to work in school-approved and school-supervised employment. They carry a regular school load besides devoting 15 hours per week to supervised out-of-school educational activities. Students receive high school credit for work performed under this programme. They also receive pay from their employers subject to the laws and regulations of the Department of Labour.

Music, art, health education and physical education have each been allotted a 50-minute period per week in the junior high school. Physical education is prescribed as an elective subject in the senior high school with a daily 50-minute period of instruction.

In all types of schools English is taught as a second language, with emphasis on oral mastery as well as developing skill in reading and writing.

The students' work is graded according to the following scale: 3.50–4.00 (A), 2.50–3.49 (B), 1.60–2.49 (C), 0.80–1.59 (D), 0.00–0.79 (E). Twelve credit units are required for graduation from the senior high school, as follows: English 2, Spanish 2, mathematics 1, science 1, Puerto Rican history ½, American history ½, general history 1, and electives 4.

Teaching staff. A register containing the names of all suitable applicants is prepared at the beginning of every semester. Candidates must either (a) possess the degree of Bachelor of Arts in Secondary Education, or the degree of Bachelor of Arts in Elementary Education—in which latter case they must have 'majored' in any of the subjects taught in the secondary schools and completed a basic course in secondary education, or (b) hold the degree of Bachelor of Arts or Science, and in addition have completed (i) a minimum of 24 semester hours in education, of which not less than 12 must be in secondary education; (ii) a course in practice teaching in the secondary school or its equivalent; and (iii) majored in any of the subjects taught in secondary school or in related areas.

When persons with the required training are not available, provisional teachers may be appointed.

Any duly certificated teacher who has satisfactorily completed a probationary period of two years is entitled to a permanent contract.

Evening high schools: Their chief object is to provide the regular high school programme to young people who were not able to complete their formal education earlier. Classes meet for three 2-hour sessions a week.

The unit method of teaching is used in all courses. Subject content is presented in the form of units or tasks, which consist of several assignments and exercises to be made up by the student. The teacher's role is that of counsellor. He gives advice and direction, furnishes the proper motivation for attacking the work, and clears up difficulties to facilitate independent study by the pupils. During regular class meetings, audio-visual aids are used liberally, especially still pictures, slides and films. Group and panel discussions, forums and lectures are frequently held in the activity period.

Summer schools. These are held each year for a period of eight weeks, beginning early in June. Three types of students are admitted: (a) regular day high school students who lack one unit of credit for graduation; (b) students who need two credits for graduation, but whose grade index is not lower than 3.00; and (c) students with a grade index of at least 2.50 who stand a good chance of gaining admission to any university in the country.

The Morovis Plan. The plan was first established in 1948/49 as an experiment at Morovis, a small town in the interior, and was later extended to other places. It was designed to furnish secondary education opportunities to towns which had neither senior high schools nor facilities to transport students to communities where such schools were functioning.

The plan permits the enrolment not only of school-age children but also of adults interested in acquiring a high

school education. The present programme of studies is identical with that of the regular high schools, and pupils may take as many courses as are offered.

The Morovis Plan schools are being discontinued in some towns with the opening of regular high schools and the extension of free transport facilities.

The Division of Free Studies and Examinations. For the benefit of students outside the regular high schools this division conducts examinations leading toward the high school diploma. These examinations are held in the months of June and December of each year for the purpose of determining the basic knowledge of the examinee in the fundamental fields required for high school graduation. The Secretary of Education has been authorized by law to award to persons who have successfully passed these examinations a diploma which is equivalent to a high school diploma for all academic and legal purposes.

Recently the division has inaugurated television courses with credit in physical sciences, algebra, and the history of music, in order to help out-of-school adolescents and adults gain a high school education. About 600 students are enrolled in these courses.

Special schools. The Public Welfare Division of the Department of Health maintains the following special schools for physically, mentally and emotionally handicapped children of secondary school age: the Commonwealth Home for Boys and the Commonwealth Home for Girls, two industrial schools for delinquents, two juvenile homes, and a school for the blind. These institutions are firmly committed to the over-all education and rehabilitation of the children in their care.

Instructors are paid a bonus of $25 per month in addition to their salary as prescribed under the salary schedule for public school teachers.

Vocational and technical schools

Vocational work is offered in three types of school: vocational high schools, comprehensive schools, and rural and urban junior high schools.

The vocational high schools are trade schools. Comprehensive high schools are regular senior high schools with a trade and industrial department; these schools also have general, college preparatory, and vocational courses in business education and education for distributive and diversified occupations. Agriculture is taught in more than one hundred 'second units' or rural junior high schools and four urban junior high schools.

Trade and industrial programmes. There are three types of programme, designated A, B and C, and entrance requirements differ for each one. The minimum age for admission to the Type A programme is 16 or 17 years, depending upon the duration of the course. Students who have reached their eighteenth birthday and who are employed in a trade or an industrial occupation may enrol in part-time and evening extension courses. Pupils beginning the Type B programme must be at least 15. Admission to Type C programmes is restricted to youths who have reached their eighteenth birthday and to boys and girls 17 years of age who have left the all-day schools.

The Type A programme is planned to give training in the manipulative part of the work and also mathematics, drawing, and science related to it. Shop teachers are required to follow the course of study drafted for each trade. The school year should be 9 months in duration and students should work 30 hours per week. At least 15 hours in periods of not less than 3 consecutive hours should be spent in shopwork each week. About 25 per cent of the school day should be devoted to related instruction. Shop and trade practice teachers should hold a high school diploma or its equivalent; they should have at least 3 years, experience as journeyman in the trade to be taught, and about 225 hours of instruction in approved professional courses in vocational education within 3 years after accepting employment as shop teachers.

The character and content of the courses of study for Type B programme is the same as for Type A except that the related instruction should be co-ordinated with shop work. This kind of instruction is given as the need for it arises in shop classes. Not less than 3 consecutive hours per day should be spent in practical work.

The Type C programme is a special type of all-day pre-employment course offering training for any length of time. Instruction is given in intensive courses in order to equip learners with the basic skills, technical knowledge, and related industrial information which will enable them to obtain a job and advance in it. Classes may be held for any length of time. Assistant supervisors and local directors may serve as co-ordinators.

Business education. There are three different types of courses: secretarial, clerical, and book-keeping. The programme is operated under a co-operative part-time plan in which the student works in an office during one semester of his senior year and attends classes during the other semester.

Education in distributive occupations. Distributive occupations are those related to the marketing or merchandizing of goods or services, and include retailing, wholesaling, manufacturing, storing, transport, and finance. During the last two years of school the student works a half-day in a business establishment and attends classes during the other half. Students should work at their occupation at least 15 hours a week for 35 weeks during the year. They spend a similar amount of time in completing the requirements for the high school diploma. The work is supervised by a teacher co-ordinator who visits the students on the job; confers with supervisors and employers to determine students' training needs; prepares course outlines; and selects instructional materials. Co-ordinators are often able to place graduates in suitable jobs.

Students employed on the part-time plan receive wages on the same basis as other workers performing similar duties.

In-service training of teachers is conducted by itinerant teachers and/or by the Commonwealth Supervisor of Distributive Occupations. Instructors are visited at least three times a year and are given individual assistance in planning their work and organizing and conducting classes. Conferences and workshops are held when needed. Whenever it is possible, advisory committees made up of

representatives from different types of business, civic organizations, and employee groups are appointed and their advice is sought on such matters as ways of improving the training programme, the occupational needs of workers, and the preparation and use of instructional materials.

Education in diversified occupations. The diversified occupations programme seeks to enable a student to go directly from school to full-time employment. The programme operates on a co-operative basis between the school, which assumes responsibility for the student's general academic and technical instruction, and local business and industrial establishments, which organize practice periods in their respective trades or occupations.

Candidates for admission to the various courses must have reached their sixteenth birthday, and must have obtained a grade of at least 'C' for their previous work. They must be physically and mentally fit. All candidates must secure their parents' consent to enrol and undergo a probationary period which may extend from six to eight weeks in their respective establishments before being finally accepted for this programme.

Representative occupations or trades for boys include drafting, furniture finishing, office machine servicing, and machine lathe operations.

Girls receive training as beauticians, dieticians, doctors' assistants, dressmakers, florists, laboratory assistants, librarians, laboratory technicians, and nursing aides.

In order to approximate more nearly to an actual job situation, the student-trainee receives a nominal wage during his training period.

Agricultural courses. Instruction is given in three different kinds of classes: (a) all-day classes for pupils attending rural junior high schools; (b) classes for out-of-school young farmers; and (c) classes for adults who are already operating farms.

The 3-year curriculum for rural junior high schools includes both vocational and non-vocational subjects. The latter, i.e., English, Spanish, mathematics, the physical sciences and the social sciences, are the same as those required of regular academic students. The former include animal husbandry, dairying, poultry, field crops, horticulture, soils, farm mechanics, marketing, rural economics, farm management, food conservation, accounting, and the like. In this way graduates are better qualified for eventual admission to colleges of agriculture or other schools.

Teachers of agriculture with three all-day groups are required to teach three classroom sessions per day and must devote at least 450 minutes per week to the supervision of home projects. However, variations from this schedule may be arranged to suit local conditions.

Instruction is of a practical nature and is related to the problems the students actually face. Supervised farm programmes have been established to provide students with an opportunity to apply the knowledge and skills being learned. Each vocational agriculture centre has a farm of from 5 to 30 acres for this purpose. Supervised practice affords experience in co-operative planning, thus fostering the development of the abilities needed for group action, and students are required to have at least six months of such practice each year.

Every teacher of agriculture is expected to keep in contact with his pupils for some time after they leave school. He encourages them to become farmers, tenant farmers, share croppers, farm managers, or to take up other occupations related to farming.

Students are eligible for membership in the Future Farmers of America, an organization which provides activities for the development of those leadership qualities which all farmer-citizens should possess.

Agriculture teachers' qualifications include a bachelor's degree in agriculture with a minimum of 12 credits in methods of teaching vocational agriculture, supervised farming, practice farming, etc. They must have either been raised on a farm or have had at least two years' farming experience. Both new and experienced teachers receive in-service training from their supervisors by means of suggested reading and courses, group meetings, conferences, workshops, and classroom visits.

Home economics education. Home economics is a required subject in the eighth and ninth grades and an elective in the senior high school programme. On this level, boys as well as girls have opportunities to receive additional training in home economics through short intensive courses on consumer problems, family relationships, education in family finance, home nursing, and other related topics. Junior high school boys may also acquire home-making experiences if home economics teachers are allowed to exchange classes with vocational agriculture or industrial arts teachers for two, three or four weeks during the year. By this technique they become familiar with clothing selection and care, personal grooming, food selection and preparation of simple nourishing meals, table manners, boy and girl relationships, and other aspects of home-making. The girls profit by learning about simple home repairs and gardening.

The home economics teacher is usually required to take four classes daily; in addition, time is provided for the supervision of home experience (by which pupils apply what they have learned in home economics classes to actual situations), home visits, club work, and other activities related to the home-making programme.

Young people who have left school are reached through the organization of formal and evening classes, and through programmes provided by the Department of Education television station.

The University of Puerto Rico is the only accredited institution in the Commonwealth for the training of home economics teachers. Prospective teachers follow a 4-year course. The first two years of the course are of a general nature, while the last two are more specialized and professional. After a thorough course in teaching methods and techniques, the prospective teachers spend eight weeks doing practice teaching in urban and rural schools under the direction of trained supervisors.

Vocational work in special schools. Reference has already been made to institutions administered by the Department of Health. Students in these institutions who have normal intelligence attend public high schools to receive instruction in academic subjects, and also enrol in vocational courses.

For those who are mentally retarded, special treatment is given at their respective institutions. They are organized

in groups of 15 to 20 according to age when this is possible. The boys take such vocational courses as auto mechanics, bookbinding, printing, tailoring, electricity, shoemaking, carpentry, woodwork, and vocational agriculture. The girls receive instruction in home economics, embroidery, hand and machine sewing, canning of fruits and sweets, native handicrafts, and many other trades and occupations.

Students may work as apprentices in shops, business establishments, homes, offices, beauty parlours, etc. Apprentice training serves the dual purpose of assisting children in the reciprocal processes of self-identification and socialization.

TRENDS AND PROBLEMS

The Commonwealth Government spends nearly one-third of the budget for the whole island in providing for its educational services. In spite of this, a great number of children are still not attending school, mainly because of the shortage of facilities. To make up for this shortage, the teacher's load has been increased to alarming proportions and more than 80 per cent of the enrolment is organized in double and interlocking sessions. A considerable number of pupils leave school prematurely.

New buildings are needed to house the growing school population and to replace more than 1,300 rented rooms. About 1,500 additional rooms will be needed to accommodate adequately the population of secondary school age by 1975. The dearth of classrooms and qualified teaching personnel is reflected in the amount and quality of the instruction imparted in the schools. During 1958/59, 38.8 per cent of all junior high school students and 16.7 per cent of all senior high were attending schools organized on an interlocking schedule. This means that a considerable proportion of secondary school students are not receiving the benefits of a full day's work.

An additional problem of the first magnitude is the need to supply the schools with a sufficient number of properly trained teachers. In August 1958 there were 1,698 secondary school teachers with provisional certificates out of a total teaching force of 3,547. The shortage is acute in every field, particularly in science and mathematics. During the school year 1957/58 there were only 5 fully qualified physics teachers and 39 mathematics teachers against an estimated minimum need of 46 and 526 respectively. In a country where Spanish is the vernacular there was a shortage of 350 certificated teachers of Spanish. About 40 per cent of the secondary school teachers leave teaching in order to take positions in government or industry which offer higher salaries. To provide one teacher for every 40 pupils the secondary schools will need over 6,000 more teachers by 1975.

A third problem is related to the provision of suitable teaching materials. Funds have been allocated to meet this need in accordance with a six-year plan. It has been estimated that over 9½ million textbooks are at present required for the public schools, but so far only a little more than half this number have been made available. The Department has recognized the need to prepare books to replace materials which were completely unsuited for teaching English as a second language and to supply Spanish materials dealing with Puerto Rican life.

No less important than the foregoing is the need to reduce the yearly number of drop-outs. Of all the pupils who enrolled in 1942/43 only 43 per cent reached the twelfth grade in 1957/58. The Committee on Human Resources has fixed a retention rate of 84.4 per cent in grades 11–12 for 1975. Except in the 9th and 10th grades, the present achievement of the schools indicates that a great deal of effort must be expended to reach the desired goals. A survey conducted in May 1958 showed that 9,640 students dropped out of high school during 1957/58. The main reasons for these drop-outs were illness, poor achievement, and economic problems. It is expected that the various welfare services provided for secondary school students will help to check withdrawals.

Finally, the work of the schools is seriously complicated by the teaching of English as a second language. From the beginning the aim of the Department of Education has been to develop a system of bilingual education which would ensure the conservation of Spanish and the acquisition of English. For about half a century, English was used as the medium of instruction in the public schools, on the theory that pupils would acquire a command of this language if they were continuously exposed to it. After many years of obervation, testing and experiments, it was found that this policy was defeating itself, inasmuch as pupils were neither acquiring English nor obtaining satisfactory results in the other subjects taught in English. This failure has been attributed to poor teaching, the use of wrong methods, and the fact that English was taught to the Puerto Rican child as it was taught to the American child. In 1934 Spanish became the official vehicle of instruction in the elementary schools and English acquired the status of a special subject; the amount of teaching time allotted to English was increased from 45 to 90 minutes daily. The new language policy, which was extended to the secondary schools in 1949, does not mean that the people of Puerto Rico have abandoned their interest in English. On the contrary, they are all the more convinced of the necessity of mastering English because of the cultural, political and economic advantages it gives, and the Commonwealth Legislature appropriates considerable sums of money each year for this purpose.

The vigour with which the people are attacking the problems outlined in this report bears witness to the faith they have placed in education as an effective means of overcoming Puerto Rico's economic and social limitations.

STATISTICS

Population (mid-year 1958 estimate): 2,316,000.
Area: 3,435 square miles; 8,897 square kilometres.
Population density: 674 per square mile; 260 per square kilometre.

Summary of school statistics, 1953–57. During the school year 1957/58 total enrolment was about 638,000 pupils, of whom 83 per cent were in elementary schools (grades 1–8), 14 per cent in secondary schools (grades 9–12) and 3 per cent in institutions of higher education. The school-going population represented approximately one-fourth of the total population. Of the 582,000 pupils enrolled in public schools, 49 per cent were girls. Total enrolment in public schools in 1957/58 was 12 per cent higher than in 1953/54 (female enrolment increased by 10 per cent during the same period). Except in the University of Puerto Rico, more than half the teaching staff were women; they represented 85 per cent for primary education and 64 per cent for secondary education. The pupil-teacher ratio was 60 in elementary schools and 18 in secondary schools. (See Table 3.)

Enrolment trends in secondary education, 1930–57. Data concerning the number of pupils in public secondary schools (grades 9–12) are given in Table 1. As this increase in enrolment was far higher than the corresponding increase of the population 15–19 years of age the secondary enrolment ratio shows a marked and steady rise.

Examination results in secondary education, 1953–56. Certificates granted to the pupils of public schools in 1956/57 numbered 10,080 as compared with 8,916 in 1953/54. The proportion granted to girls was 56 per cent in 1956/57 and 53 per cent in 1953/54.

Educational finance, 1955/56. In the fiscal year beginning September 1955, a total of 67 million dollars was spent on public schools. Of this amount, 17 per cent was contributed by the Federal Government, 14 per cent by territorial revenue, 66 per cent by local authorities and the remainder from tuition fees, private gifts, grants, etc. Recurring expenditure represented 96 per cent of the total expenditure. (See Table 2.)

VIRGIN ISLANDS

THE EDUCATIONAL SYSTEM

The powers of Government in the Virgin Islands are derived from Acts of the United States Congress. The Revised Organic Act of 1954 (Acts of Congress, 22 July 1954, Ch. 558, 68 Stat. 497) provides for a Department of Education, headed by a Commissioner of Education who is appointed by the Governor with the advice and consent of the Legislature. Prior laws, ordinances, and executive orders dealing with education were consolidated in the Virgin Islands Code, which was adopted by the Legislature of the Virgin Islands on 16 May 1957.

The Department of Education exercises general control over the enforcement of laws relating to education. The Department includes a Board of Education and a Board for Vocational Education, members of which are appointed by the Governor. The Board of Education has authority to establish, maintain and manage the public schools of the Virgin Islands. The Board for Vocational Education has jurisdiction over industrial, trade, home economics, and distributive education; it also provides for investigations and studies to be made of vocational education.

There are a number of private schools, including parochial institutions. Teachers in these schools must be licensed by the Board of Education, whose decisions in the matter are subject to review by the Governor. Private schools may apply to the Commissioner of Education for a certificate of accreditation, which is granted to those meeting certain prescribed standards; accredited schools are inspected at least once a year.

The population of the Virgin Islands is predominantly Negro. English is the language in common usage, and is the language of instruction in the schools.

THE DEVELOPMENT OF SECONDARY EDUCATION

The Virgin Islands of the United States of America were formerly the Danish West Indies. In 1841 several public schools were opened on the island of St. Croix, but under Danish administration education was provided mainly by the Protestant and Catholic Churches, with financial assistance from the Government and under its general supervision. Attendance was compulsory between the ages of 7 and 13. Free education at the secondary level was virtually non-existent.

When the islands were transferred to United States control in 1917, steps were taken to secularize the schools and to extend educational opportunities. Government aid to church schools was discontinued, public schools were placed under the supervision of a civilian director, and the foundations were laid of a comprehensive public educational system.

The 6–3 plan of school organization was adopted and teachers volunteered their services after school hours to assist the few students who wished to continue their schooling beyond grade 9. With the beginning of the school year 1931/32, the St. Thomas Junior High School was reorganized as a 6-year junior-senior high school (grades 7 to 12) and became the first full-term secondary school in the Virgin Islands; it is now known as the Charlotte Amalie High School. The Christiansted High School was an outgrowth of a vocational institute established in 1932, jointly sponsored by the Department of Education and the Agricultural Experiment Station and financed by a federal appropriation. When the institute was discontinued, the Department of Education assumed direct responsibility for

a limited programme in agricultural training, and the students in academic classes were enrolled in the senior division of what became the Christiansted High School. Graduates of the Frederiksted Junior High School in St.Croix, the only remaining 3-year secondary school, go on the Christiansted High School.

Besides the public secondary schools there are three high schools operated by the Roman Catholic Church; the Catholic schools are organized on the 8–4 pattern.

Administration

Laws applicable to education in general are deemed to apply to education at the secondary level. The Department of Education must supply free textbooks. The Commissioner of Education administers the high school equivalency programme for young adults, regulates the admission, dismissal, and transfer of pupils, and administers the apprenticeship training programme. Compulsory school attendance begins when children are at least 5 years 6 months' old at the beginning of a school year and ends with the school year nearest the fifteenth birthday.

In the public school system, policy planning for the secondary programme as a whole, curricula, personnel, finance, etc., are the special province of the head of the secondary schools section of the Division of Educational Programs. He works closely with principals and teachers, and with the Commissioner of Education, whose decisions, subject to budget provision and adoption by the Board of Education, establish the extent and pattern of the secondary programme in the public school system.

In the parochial schools, the programme is established and controlled by the authorities of the Roman Catholic Church.

Inasmuch as there are no regional or local authorities or boards, the Department of Education has direct control of public secondary schools. There are no other public authorities administering schools at the secondary level, but other executive departments of the Virgin Islands Government co-operate with the Department of Education in matters which come within their respective areas of competence, e.g., the Department of Finance, the Department of Public Works, the Department of Health (medical examinations and free clinical services), the Department of Public Welfare (assistance to needy parents and children) and the Virgin Islands Employment Service (assistance in placing graduates and working students).

Supervision of various aspects of school operation is carried out by officials of the Department, reporting directly to the Commissioner of Education. No routine inspection is made of non-public schools, but only as occasion demands or warrants.

Parent-teacher associations are active and helpful in some of the high schools.

Finance. Except for federal aid to specific phases of secondary education, all funds for support of education are derived from appropriations made by the Virgin Islands Legislature from the over-all revenues of the Virgin Islands. These revenues are derived chiefly from real property taxes, income tax, trade and gross receipts taxes, custom dues and from licences, fees, fines and penalties. Annual appropriations are based on estimated requirements prepared by the Department of Education.

For the year 1959/60 an appropriation of $1,630,500 was approved by the Governor for the Department of Education, representing approximately 22 per cent of the estimated total revenues of the Virgin Islands Government from all sources. Of this amount, the sum of $410,000 was budgeted for secondary education, approximately equal to 25 per cent of the estimated expenditure of the Department, exclusive of federal aid.

Funds are not distributed to schools. All school expenses are handled directly by the Department of Education, including payment of teachers, janitors, clerks, purchase of books and equipment, and other operating and maintenance costs. No fees are charged.

Assistance to parents is provided only in the case of high school students from the island of St. John attending school in St. Thomas; the parents of such students receive $20 per month.

Buildings and equipment. All public secondary schools are now housed in new, well designed, fireproof buildings. These include, besides regular classrooms, auditoriums, libraries, clinic rooms, well equipped laboratories and shops, spacious luncheon rooms and kitchens. They are located on grounds providing ample space for building expansion and facilities for outdoor athletic and recreational activities.

School welfare services. Free medical and dental care and free hospitalization are provided for all children whose parents cannot afford regular fees. Bus transport is free for pupils who live beyond reasonable walking distance from a high school, and lunches are provided for all pupils who choose to participate in the lunch programme.

TYPES OF SECONDARY EDUCATION

Public secondary schools are of the comprehensive type. The smaller Roman Catholic high schools are 'general' secondary schools, providing mainly the academic type of programme in traditional subjects, but including in some instances training in typing, stenography, and related commercial subjects, and also, of course, religious education and training.

In recent years, especially with the expansion and development of vocational facilities since the beginning of federal aid in 1950, efforts have been made to organize and develop guidance services in the public high schools. It is probable that in the near future additional trained personnel may be engaged.

There are no institutions, nor any regular or continuing programme or service to provide for further education and training of secondary school leavers, although there have been sporadic courses from time to time when justified by the demand and when funds have been available.

For all public schools, elementary and secondary, the school year begins early in September and ends on the last Friday of June. Schools observe all public holidays and have two weeks' vacation at both Christmas and Easter. The school week is from Monday to Friday. Most high

school students are in class for about four and a half hours daily, but those in trades and industry courses in the vocational programme have a 6-hour school day.

Secondary school programmes. These include general, academic (college preparatory), and vocational education. As regards aims, there are two statements which are intended to serve those responsible for administration of the school system. One is the report of the Educational Survey of the Virgin Islands, submitted to the Secretary of the Navy on 30 January 1959. The report lists objectives of education directly related to the social, economic, and cultural needs of the Islands: rebuilding family life to provide each child with protection and training in a wholesome environment; establishing good health habits to reduce the high death rate and particularly the high infant mortality rate; industrial training to build a productive economic life; encouraging community participation in the improvement of schools and all other public enterprises; acquiring skills in reading, writing and arithmetic, and cultural attainments in music, arts and crafts, all of them closely related to local conditions rather than adopted bodily from the continental United States. The other list of objectives is contained in the report of the Virgin Islands White House Conference Committee to the White House Conference on Education in 1955. The report stated that the schools should develop individuals who think critically, have a sense of spiritual and cultural values, are conscious of civic responsibilities, and aware of good human relations, both individual and world-wide.

In the years immediately following the addition of the senior high school grades to the two former junior high schools, the programme of studies followed a traditional pattern aimed, principally, at qualifying graduates for admission to colleges and universities in the United States. Enrolment in the senior division in those years was highly selective, and a majority of the graduates did pursue higher education. With increasing enrolments, however, in both the junior and senior divisions, these schools tended to accept and retain more and more children of secondary school age and those qualifying for and choosing to pursue higher education constituted a small minority of all pupils completing the secondary course. The first attempt at differentiation resulted in the adoption of two patterns or programmes of study: one the 'general course', for those who would not or could not qualify for higher education, and the other the 'academic' or college preparatory programme. Domestic science and manual training had been included in the junior high school programmes and were extended as subjects in the senior divisions, especially for students in the general course.

This arrangement fell far short of serving the best interest of the rapidly growing number of high school graduates each year who would be seeking employment in trades, offices, or business in their communities. Greater diversification of programmes, especially in upper grades, came with the addition of a 'commercial' programme in St. Thomas in 1935, and in 1940, in a limited way, a programme in trades for boys. It was not until 1950, however, with the extension to the Virgin Islands of federal aid for vocational education, that these schools began to assume present-day patterns.

The public secondary schools now accept and retain virtually all students who complete elementary school and choose to enter and complete secondary education. In the junior division, homogeneous grouping on the basis of achievement determines the organization of classes within grades. In the senior division, owing to the diversity of programme, placement depends more upon aptitude, interest, and the pupil's prospective career upon graduation, although ability and past achievement are considered in counselling students concerning choice of programme.

Achievement testing. Comprehensive tests are administered each year to all students in the ninth and twelfth grades, and the results are reviewed in comparison with established norms. Quarterly reports are made by teachers to parents, giving ratings using an A B C D E system. Teacher-prepared examinations are given at mid-year and at the end of the school year. A final rating of 'D' is accepted as satisfactory for completion of a given subject but an average of 'C' is required for promotion to a higher grade.

Teaching staff. All teachers are required by law to hold a Teacher's Certificate issued by the Commissioner of Education. There is no mention in law of specific requirements for qualification of teachers for duty in secondary schools as distinguished from teachers in general. A recent ruling of the Board of Education demands a minimum of completion of two years (or 60 semester hours) of post-high school training in an accredited institution to qualify for certification. It has also been decided that secondary teachers should hold a degree from an accredited college or university, and that the candidates' preparation should include completion of two or more courses in education and a major in the subject to be taught. Virtually all high school teachers now in service possess this qualification, and a substantial number in each school hold a master's degree.

The majority of the teachers employed are natives of the Virgin Islands who have completed secondary education in the Island high schools and higher education in institutions in the United States. The remaining teachers have been recruited from the United States or from Puerto Rico.

Out-of-class activities. Students in the two larger high schools participate to a fair extent in athletic sports and games. There are inter-class competitions and an annual inter-island competition between the two public high schools during the Easter vacation, including contests in baseball, volley ball, soft ball, and track and field events. A Girl Guide troop is sponsored by the Charlotte Amalie High School, which has also a Future Nurses Club and a Chapter of the Future Homemakers of America.

TRENDS AND PROBLEMS

It is unlikely that the secondary schools will undergo marked changes in basic organization or pattern in the near future. However, continuing efforts will be made toward revision of course content better to meet the abilities, aptitudes and interests of the pupil.

With respect to enrolments, the trend in recent years has

been towards an annual increase, especially at the secondary level. As secondary education has ceased to be the privilege of a rather select group and become available to the majority of children of secondary school age, a number of problems have arisen. The urgent need for teachers has made it necessary to engage not only persons who have chosen to make teaching their career, but others who look upon it more as a job than a vocation. This attitude may, in part, account for a certain deterioration in pupil morale in the higher grades. It is hoped that better methods will be found of helping teachers to meet imaginatively the challenges implicit in offering educational opportunity to all children. It is also hoped that improved planning, guidance and instructional methods will at the same time permit better adaptation of programmes to suit the needs of particular groups, especially among students pursuing a general course. Efforts along these lines should raise teacher performance and pupil morale.

It is expected that there will be a growing demand for expansion of facilities for vocational education to serve the interests of the majority of pupils who, upon leaving secondary school, will seek employment locally in trades, offices, or business establishments.

STATISTICS

Population (mid-year 1958 estimate): 31,000.
Area: 133 square miles; 344 square kilometres.
Population density: 233 per square mile; 90 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment in kindergartens, primary and secondary schools was 8,696 pupils, representing about 28 per cent of the total population. Nearly three-fourths of all pupils were in public schools, where the average number of pupils per teacher was 30. Between 1953 and 1957 school enrolment increased by 13 per cent. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Table 3 shows rapid increase in enrolment of public schools during the period, so that the average for 1955–57 was nine times as high as that for 1930–34. For the most recent period, the average enrolment represented about 90 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1955–57. The annual numbers of graduates from secondary schools were as follows: 1955/56, 150 (F. 76); 1956/57, 137 (F. 69); 1957/58, 183 (F. 92).

Educational finance, 1955/56. Total expenditure for public schools amounted to 1.1 million U.S. dollars for the school year beginning in September 1955. This represented an average expenditure of about $46 per inhabitant. About 88 per cent of the receipts for public education was derived from the Territory. (See Table 2.)

AMERICAN SAMOA

American Samoa is an insular possession of the United States of America administered by the Department of the Interior. It comprises the eastern islands of the Samoan group, which lie approximately 2,300 miles south-west of Hawaii and 1,600 miles north-east of the northern tip of New Zealand, in a direct line. There are seven islands in the American Samoa group. The capital, Pago Pago, and the central administrative offices are on the island of Tutuila.

THE EDUCATIONAL SYSTEM

The statutory basis of the educational system as a whole is found in Chapter 8, Education, Sections 561–83 of the Code of American Samoa dated 11 June 1949. The educational system is organized into an elementary division, grades 1–9, and a secondary division, grades 10–13. However, for the purposes of this chapter, secondary education will be considered as covering grades 7–13.

The main aim is to provide training which will enable the people to serve more effectively within their social, economic, professional and political structure. (A total of 37.5 per cent of all high school graduates since the first graduating class of 1950 is now employed by the Government of American Samoa.) At the same time, it is believed that the school system should provide a suitable background for those who will find it possible to take advantage of opportunities for higher education in the United States of America or other countries. Along with mastery of English (the official language), the aim is to provide mastery of basic skills related to science, medicine, law, business, the arts and other fields. As the Samoans are influenced more and more by contact with Western civilization, the Government of American Samoa recognizes its responsibility for preserving Samoan culture while encouraging all changes beneficial to health and well-being.

The Government also wishes to help the Samoan people, through education, to preserve and develop their economic resources, so that they may be able to cope with the problem of an expanding population and the increasing demands which accompany modern society, and to become as self-supporting as possible.

In line with these objectives, the policy of the Department of Education is as follows:

Curriculum. (a) Instruction in both the Samoan and English languages in the elementary schools; (b) the fundamental processes of reading, writing, and arithmetic; (c) science and health; (d) social studies with emphasis on Samoan culture, government and environment; (e) vocational preparation; (f) a vocational pursuit.

School organization. Continuation of the village elementary schools (grades 1–6); the junior high schools (grades 7–9); the senior high school (grades 10–12); the vocational school (grades 10–12) (the two latter schools for a select group of junior high school graduates); and the post-high school teacher training college (grade 13). It is proposed to expand this latter programme to a 2-year course.

Compulsory education. Continuation of the long-established and popular policy of compulsory education from age 7 to 15.

Buildings and equipment. Maintenance of buildings and equipment to keep pace with an expanding population. The general policy is that the financing of education should be a matter for co-operation between the local communities and the Government, but that as a school becomes more advanced in character the Government should provide additional support. In the elementary schools the villages provide the school buildings and teachers' living quarters; the Government provides teachers, equipment and supplies. In the junior high schools, high school, vocational school, dependents' school, demonstration school and teacher training college, the Government has sole responsibility.

Scholarships. Provision of scholarships and special training for qualified Samoans in needed fields as available.

Standards. Maintenance of the policy of upgrading the entire school system as rapidly as possible, initial emphasis being placed on the five junior high schools, which will prepare a better trained group of young people for the high school and for community life. Special attention is given to the teacher training college and the related demonstration school.

The Governor of American Samoa is ultimately responsible for all public education. He is advised on policy matters by a Board of Education consisting of seven members, including the Director of Education as chairman, three members appointed by the Governor, and three members elected to represent the three districts of American Samoa.

In addition to the public school system there are seven private schools run by four religious organizations: an elementary school (grades 1–6), a junior high school (grades 7–9), and five combined elementary-secondary schools (grades 1–9). About one-sixth of the total number of school-age students attend these schools. Another mission has under construction a junior-senior high school, with plans to add elementary and junior college divisions.

THE DEVELOPMENT OF SECONDARY EDUCATION

When the United States of America assumed control of Tutuila in 1900, the only school then existing on the island was one for boys conducted by the London Missionary Society. The first government school, a primary institution, was opened in 1904, and was followed by several others. However, the public school system did not really start till 1921.

During World War II the secondary schools were closed. The big addition to post-war Samoan education came with the founding of the high school in 1946; in 1948 the high school and Feleti school were combined into one institution known as the High School of American Samoa. In 1952 the teacher training classes, a part of the high school since its establishment, were set up as an independent, post-secondary institution, known since 1957 as the Feleti Memorial Teacher Training College. This school provides the highest academic training available in the territory.

A vocational programme was offered as part of the high school curriculum until 1952, when a separate Vocational School of American Samoa was established.

Administration. Secondary policy is planned and carried out by the Director of Education, the Superintendent of Secondary Education, the Supervisor of the Vocational School, and the Supervisor of the Teacher Training College and Demonstration School.

The function of the Office of the Director of Education is the general administration of the school system in direct regard to objectives and long-range plans set forth by the Governor of American Samoa. The office is also responsible for co-ordinating the activities of private schools, in order to ensure the fulfilment of basic educational objectives and policies, and for educational public relations on the village and district level.

The Division of Secondary Education controls the administration of grades 10 to 13, including the high school, vocational school, and teacher training college. It is responsible for the selection of textbooks, the management of secondary education budgets, the supervision of entrance examinations, the establishment of rules and regulations covering training, and the application of curricula set forth

and approved by the Director of Education. It conducts an adult educational testing programme.

The Director of Education supervises and inspects all schools. Inspection of junior high schools is carried out by the Superintendent of Elementary Education, the Village Schools Supervisor, and an Education District Supervisor. Supervision of other secondary schools (high school, vocational school and teacher training college) is undertaken by the persons responsible for these schools, the Superintendent of Secondary Education (who acts as high school principal), the Supervisor of the Vocational School, and the Supervisor of the Teacher Training College and Demonstration School.

A Samoan Public Health Nurse makes at least weekly visits to the outlying junior high schools. The services of the Hospital of American Samoa are available daily to all secondary school students in the Pago Pago Bay area.

Public education in American Samoa is financed by the Government of American Samoa out of funds derived from local revenues (about 33 per cent), supplemented as necessary by federal grants (about 66 per cent). Private schools receive no financial support from the Government. The Department of Budget and Finance makes funds available on a quarterly basis to the Department of Education. Funds for building construction and maintenance are budgeted for and expended by the Department of Public Works, not the Department of Education. The Frederic Duclos Barstow Foundation for American Samoans, of Honolulu (Hawaii), gives some financial aid to secondary education. During the 1958/59 academic year it provided scholarships, partial subsistence, or transportation funds to students, funds for teachers from Hawaii and the mainland to attend the Teachers' Institute in Samoa, and for a Samoan educational administrator to attend the South Pacific Commission Regional Education Seminar in Australia.

TYPES OF SECONDARY EDUCATION

Almost all children who complete grade 6 continue their education in the junior high schools (grades 7–9); on completion of grade 9 students are awarded either a certificate of attendance or a certificate of graduation. Education beyond junior high school includes the high school, the vocational school and the nursing school. Entrance to these is through an examination taken yearly by all 9th-grade students in public and private schools.

Administration and instruction in the junior high schools are carried out by locally-educated Samoans. The English-Samoan language ratio for instruction is 75 per cent to 25 per cent. The present junior high school curriculum consists of general science, social studies, arithmetic, English, reading, spelling, music and art, health, and practical agriculture. Social studies includes Samoan culture (grade 8) and Samoan government (grade 9). Instruction is based principally on standard junior high school textbooks published in the United States of America.

The High School of American Samoa. The course covers grades 10 to 12, admission being based upon examination of grade 9 students. The language of instruction is English, and the pupils use standard high school textbooks published in the United States. The subjects, which meet the requirements of United States certification agencies, are English, ancient history, world history, United States history, biology, physics, chemistry, senior science, business mathematics, algebra, geometry, shorthand, typewriting, bookkeeping, and office practice. Grade 11 students choose a general or commercial course to continue through grade 12. A diploma of graduation is awarded on completion of grade 12. The teachers are all university graduates.

Students who desire university or advanced technical school training usually go to Hawaii or to the mainland of the United States. A few high school graduates are sent to the Central Medical School in Suva, Fiji, for training as medical and dental practitioners, pharmacists and laboratory technicians; and two junior high school students are sent every year to the Central Agricultural School in Apia, Western Samoa.

The Vocational School of American Samoa. This school, which is composed of grades 10–12, provides special training in crafts and the use of trade tools. Boys, who are selected 9th-grade graduates, are trained in cabinet work, carpentry, machine work, electricity, boat repairing, sawmilling, auto mechanics, and plumbing—with the ultimate objective of doing work typical of local conditions. The curriculum also includes blue-printing, surveying, English and mathematics. Second- and third-year training is offered to outstanding students. These grade 11 and 12 students also attend high school classes in English and science. On completion of grade 12, a diploma of graduation is awarded by the High School of American Samoa.

The nursing school. This school for girls, who are selected 9th-grade graduates, is a 4-year institution operated by the Department of Medical Services. In addition to their professional studies and nursing practice, the girls attend high school classes in science, mathematics and English. At the completion of their course they are awarded a Nursing Certificate and a diploma of graduation from the High School of American Samoa.

Industrial training. There is no formal system of apprenticeship. Instruction exists informally in 'on-the-job' training for the young helpers of specialists, technicians and mechanics employed by private industry or by the Government of American Samoa.

Teacher training. The Feleti Memorial Teacher Training College operated as a 1½-year course from February 1958 until June 1959, but plans have been made to extend the programme to a 2-year course. Students admitted must be high school graduates. The function of the college is to train teachers in the basic skills of instruction, with special reference to teaching in the elementary schools. Courses offered in the college include English composition, general science, conservation of resources, the Pacific region, basic English usage, child growth, the teaching of science in the elementary school, exploring the elementary school curriculum, Samoan culture, and practice teaching. Graduates from the college are employed immediately upon graduation to teach in the elementary and junior high schools.

A Teachers' Institute is held yearly to keep Samoan educators abreast of new techniques and methods. It lasts five weeks and is attended by all Samoan teachers, principals, and supervisors. Instruction is provided by teachers from the United States mainland.

Out-of-class activities. Pupils at the high school elect every year a student council comprising a president, vice-president, secretary, treasurer, and class representatives; they also have their own police and court organizations for law enforcement within the school. Four times a week there are 'activity' periods related to homemaking, athletics, the band, the school yearbook, the newspaper, and the library.

High school, vocational school and junior high school pupils all participate in interschool games, as part of a planned recreational programme of the Department of Education.

TRENDS AND PROBLEMS

To meet the unprecendented demand in Samoa for secondary education beyond the ninth grade, opportunities will have to be widened. Unless this is done, the present 30 per cent of 9th-grade graduates who can be accommodated in senior high school will decrease to around 10 or 15 per cent as the junior high school enrolment expands.

The Department of Education is planning to build one 25-room, two 20-room, and two 15-room junior high schools, one 16-room and three 10-room additions to the high school, a high school auditorium, a 15-room teacher training college and demonstration school, and a 10-room school for English-speaking pupils.

In developing the educational programme, care will be taken to provide for the needs of all students, bearing in mind that over 50 per cent of the secondary school graduates leave American Samoa for Hawaii or the mainland.

A government scholarship programme is essential in order to provide education abroad for qualified students who wish to train themselves for service in Samoa. There is also a great need of locally prepared textbooks for Samoan students.

Adequate and attractive salaries should be provided for teachers so that they will remain in the profession. In order to meet the demand for qualified teachers, the teacher training programme should be expanded to a 2-, 3- and finally a 4-year course.

Mobile libraries of supplementary reading materials to visit the village schools and junior high schools would greatly improve the standard of instruction.

STATISTICS

Population (mid-year 1958 estimate): 21,000.
Area: 76 square miles; 197 square kilometres.
Population density: 276 per square mile; 107 per square kilometre.

Summary of school statistics, 1953–57. During the 1957 school year 6,000 pupils were enrolled at educational institutions. Total enrolment was 9 per cent more in 1957 than in 1953 although 3 per cent less than in 1956. Primary enrolment (grades 1–9) increased by 10 per cent between 1953 and 1957 while secondary enrolment (grades 10–12) decreased by 11 per cent during the same period.

Between 1953 and 1957 the proportion of girls enrolled at primary schools increased slightly from 45 per cent in 1953 to 47 per cent in 1957. The proportion of girls in secondary schools was 28 per cent in 1957 compared with 12 per cent in 1953.

The teaching staff numbered 278 in 1957 as compared with 192 in 1953; women represented 34 per cent of the primary teaching staff in 1957. There were 23 pupils per teacher in primary education in 1957 compared with 30 pupils per teacher in 1953. (See table.)

Enrolment trends in secondary education, 1953–57. The number of pupils enrolled in public secondary schools (grades 9–12) increased from only 72 in 1937 to 500 in 1957 with a peak of 655 in 1947.

Examination results in secondary education, 1953–57. In 1953/54, 11 certificates were awarded to pupils of public schools, 48 (F. 7) in 1955/56, and 53 (F. 19) in 1957/58.

Educational finance, 1955/56. For the fiscal year beginning September 1955 receipts from the Federal Government amounted to 295,000 U.S. dollars. Of this sum $45,000 was spent on central administration and $247,000 on public primary and secondary education. Receipts from local sources are not known.

1. In addition, there was one part-time teacher.

GUAM

THE EDUCATIONAL SYSTEM

The Territory of Guam forms one single public school district; local public school districts like those commonly found in the United States of America do not exist. General policies for the administration of the school system are contained in Public Law 83, First Guam Legislature.

In accordance with provisions of the Organic Act of Guam, the Department of Education is under the general cognizance of the Governor of the Territory. The Department is administered through the Territorial Board of Education and the Director of Education. The board is appointed by the Governor, with the confirmation of the Legislature. Voting members, five in number, are required to be citizens of the United States and legal residents of Guam; in addition, there are two non-voting members who represent branches of the armed forces stationed on the island.

All executive and administrative functions of the Department are invested in the Director of Education, a United States civilian, who is the executive officer of the board. He is assisted by two superintendents of schools: one has general charge over personnel and the instructional programme, the other is in charge of business affairs. In addition, there are four school programme consultants, four specialists in subject areas, twenty-two elementary school principals, one junior high school principal, one junior-senior high school principal, one senior high school principal, and a Dean of the Territorial College of Guam.

The public schools have educational objectives similar to those commonly established for public schools on the American mainland. However, in view of the fact that the physical and social environment of Guam is in a number of respects unlike that which prevails on the mainland, certain adjustments have to be made. Some of the educational objectives of the public school system are: (a) to

provide a free, public school education for all children between the ages of 6 and 16 inclusive—such education to be provided without distinction as to sex, race, or religion; (b) to instil in students a deep and abiding faith in democracy as a way of life and a willingness to accept the responsibilities and obligations which are inherently a part of the democratic way of life; (c) to discover and awaken the capacities of children so as to permit them to utilize effectively the common arts of communication; (d) to give meaningful instruction in the English language; (e) to provide knowledge and an appreciation of local history, customs, and cultural institutions so as to prepare the individual for effective living in his own community.

Attainment of these objectives is sought at all levels of the public school system—primary, secondary and higher.

Education at primary level, known as elementary education, comprises the biggest division in Guam's educational system. In a general sense it is defined, for purposes of instruction, as being the educational programme provided for pupils enrolled in grades 1 to 6 inclusive.

Generally speaking, secondary education in the public schools is defined as being the educational programme provided for pupils enrolled in grades 7 to 12 inclusive.

At the present time there are two institutions of higher education: the Territorial College of Guam and the Father Duenas Memorial School. The Territorial College, operated by the Government, offers a 2-year course. The Father Duenas School is both a high school and a minor preparatory seminary of the Roman Catholic church.

THE DEVELOPMENT OF SECONDARY EDUCATION

Public education in Guam dates from 22 January 1900, when the first American governor issued General Order No. 12 placing education 'under the supervision and exclusive control of the Government'. The order also provided for compulsory attendance between 8 and 14 years of age; the leaving age was later raised to 16.

High school courses were first offered on the island of Guam in the year 1917; they were designed primarily for the purpose of upgrading teachers in the public schools. Naval officers served as instructors.

George Washington High School, Guam's only public high school now operating, was established in 1936. Like its predecessors, the pre-war Washington High School offered only a limited number of non-academic subjects. In the academic field, a standard high school curriculum prevailed. Until the Territorial College of Guam was established in 1952, the overwhelming majority of Guamanian students could expect no formal education beyond the twelfth grade, as few could afford to pursue further studies in mainland colleges or universities.

Vocational education has been a part of Guam's school programme for many years. As early as the first decade of American rule, a system of apprenticeship training was inaugurated in the island's schools. In 1917 an industrial arts teacher was recruited from the Philippines and local crafts and practical arts became an important part of the curriculum. An agricultural school, established in 1905, was incorporated into the public school system in the 1930s. By 1941 vocational education, operated in conjunction with the Public Works and other departments, was an important part of the island's educational programme.

At the present time public secondary education consists of the programmes offered to pupils in grades 9 to 12 inclusive at George Washington High School. As of 23 January 1959 enrolment was 1,853. Other high schools (with enrolment figures at the same date) are the Father Duenas Memorial School (Roman Catholic), 142; the Academy of Our Lady of Guam (Roman Catholic), 184; and the Far Eastern Island Mission Academy (Seventh Day Adventist), 18.

Administration. Provisions for the administration of public secondary education come within the arrangements for the whole system as described above.

Planning and policy functions affecting public secondary education are exercised by the Territorial Board of Education, the Director of Education, the Superintendent of Schools, and the principal of the George Washington High School. It is anticipated that a secondary school programme consultant will be employed shortly; he will act in an advisory capacity in all matters related to public secondary education. Teachers too are expected to participate in the formulation of certain policies.

Control of secondary education passes from the Territorial Board of Education and the Director of Education to the Superintendent of Schools, thence to administrators of schools at the secondary level. This is true primarily of public secondary schools. Board of Education control over private secondary schools is exercised only in the matter of pupil attendance.

The Territorial Government is responsible for the financial support of public secondary education and funds are appropriated out of general revenues. Supplementary federal funds are made available for various programmes. Government expenditure on public education covers construction and maintenance of buildings, salaries of teachers and other staff members, equipment and supplies, and transport of pupils living a prescribed distance from school. With the exception of books and transport, education in private secondary schools is provided at no expense to the Government.

Standards are laid down for buildings and equipment. General purpose classrooms are required to have an area of 900 square feet per room with 30 students per class. Special rooms including art and music rooms, workshops, science laboratories, rooms specially equipped with audio-visual aids, library and cafeteria are necessarily larger. Other provisions are shower facilities for athletic activities, health room, teachers' lounge, maintenance room, and administrative offices including business office, mimeo and workroom, and offices for the principal, assistant principal, and counsellors. Lighting and sanitary standards conform to the recommendations of the National Education Association and the Department of Health, Education and Welfare.

TYPES OF SECONDARY EDUCATION

George Washington High School, Guam's only public high school, offers four types of curriculum: college preparatory,

commercial, vocational, and general educational. Courses are offered in 11 departments: art, commercial, English, foreign language, health and physical education, home economics, industrial arts and vocational education, mathematics, music, science, and social studies.

To graduate from the high school a student must have completed 16 units in academic courses and 2 units in non-academic courses, a total of 18 units. An academic unit is a full-credit course of 55-minute periods 5 days per week for a minimum of 36 weeks; or two one-semester courses, totalling one full credit.

As of 14 May 1957 George Washington High School was granted membership of the North Central Accreditation Association of Secondary Schools and Colleges.

The private secondary schools seek to fulfil the educational aims and objectives of the churches which sponsor these schools.

TRENDS AND PROBLEMS

The problems of secondary education in Guam are in many respects similar to those which prevail in communities in the United States, but are more complex owing to local conditions and the great distance between Guam and the mainland. Recruitment of teachers, for example, is adversely affected by the fact that the current salary schedule is not competitive with those existing in many states, by the higher cost of living, and the shortage of government housing. Personnel turnover on Guam creates problems. Since the teachers are coming into a new environment the orientation period is longer than for most staff changes in the United States. Replacement of teachers during the school year is difficult. Vacancies during the school term are created more often on Guam than in mainland schools, because teachers who are armed forces dependents are subject to transfer at any time; but few qualified substitute teachers are available. There are also the psychological implications of teachers accepting a contract knowing that they will probably not stay beyond the time of the initial contract.

STATISTICS

Population (mid-year 1958 estimate): 38,000.
Area: 206 square miles; 534 square kilometres.
Population density: 184 per square mile; 71 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 total enrolment in public schools was 13,000, an increase of 24 per cent over the figure for 1953. The Territorial College doubled its enrolment during this period. The proportion of girls may be estimated at about half of the total enrolment. The pupil-teacher ratio changed very little from 1953 to 1957, going from 29 to 28 in elementary schools and from 27 to 24 in the public high school. (See Table 1.)

Enrolment trends in secondary education, 1931–57. From 1931 to 1955, enrolment in the public secondary school increased from 91 to 2,238. Since the total population is relatively small, the secondary enrolment ratio is quite sensitive to any fluctuations and this explains the very high increase from only 5 in 1931 to 48 in 1955–57. (See Table 3.)

Examination results in secondary education, 1953–57. In 1957/58, 324 certificates were granted to pupils of public schools, an increase of 59 per cent since 1953. Girls obtained 52 per cent of the certificates awarded in 1953 and 60 per cent in 1957.

Educational finance, 1955/56. During the fiscal year beginning in September 1955, 96 per cent of the recurring expenditure was covered by local authorities. Of the total expenditure on public schools, 63 per cent was recurring expenditure and 37 per cent capital expenditure. (See Table 2.)

PACIFIC ISLANDS

Trust Territory

The Territory consists of over 2,000 islands and atolls lying between latitudes 1° and 20° north and longitudes 130° and 172° east—a vast area of the Pacific roughly equivalent to the land area of the United States. The islands belong to three main groups, the Marshalls, the Carolines and the Marianas,[1] but are at present administered as seven districts: Saipan, Rota, Koror, Yap, Truk, Ponape and the Marshalls. The indigenous inhabitants, broadly classed as Micronesians, are at various stages of social evolution. Nine individual languages, with distinctive dialects, are spoken and there is considerable cultural diversity.

THE EDUCATIONAL SYSTEM

The Code of the Trust Territory of the Pacific Islands places on the High Commissioner responsibility for establishing and operating a free public school system. The code also establishes a Department of Education, headed by a Director of Education who is on the staff of the High Commissioner and responsible to him for the general supervision and administration of education throughout the Territory. At district level these duties are performed by district departments of education, headed by district educational administrators. To ensure that the people shall be the ultimate source of educational authority provision has been made within the code for the organization of district and community boards of education. In lieu of regularly constituted boards of education, district congresses or community councils may have an educational committee. As far as possible, all persons concerned with educational administration participate in the formulation of policy and they, in turn, are guided by the desires and needs of the people themselves; thus the formulation of educational policy for whatever level of education is a two-way process, coming from the 'grass roots' upward at the same time as it is going from the Director of Education downward. Other departments—Fisheries, Agriculture, Communications, Public Health, Public Works, Finance,

1. Although geographically within the Marianas, Guam has been a United States possession since 1898 and does not form part of the Trust Territory.

Administration, etc.—co-operate with the Department of Education in matters coming within their respective competencies. It is recognized by all government personnel that the prime function of the administration of the trusteeship is education.

In addition to schools maintained by public funds, there are a number of schools operated by Protestant and Catholic missions. They are required to meet curriculum standards established for all schools of the Territory but are free of any other regulations. The Bill of Rights in the Code of the Trust Territory prohibits the use of public money for religious institutions or personnel, but the Education Department helps mission schools by supplying advice and encouraging mission teachers to attend training seminars conducted by district departments of education.

The school system in Micronesia follows a 6-3-3 pattern: six years of primary education in the elementary school (grades 1 to 6); three years of lower secondary education in the intermediate school (grades 7 to 9); and three of upper secondary in senior high school (grades 10 to 12). There are no institutions for higher education in the Trust Territory; scholarships are available to enable selected students to continue their studies overseas.

The code requires compulsory school attendance of all children between 8 and 14, although attendance regulations can be adapted to meet local situations. These laws on compulsory education apply only to elementary schools. Sometimes children entering grade 1 are younger than the legal commencing age. Education begins in the native tongue, English being introduced as a subject of instruction as soon as the pupils are ready for it and provided that the teacher is literate in English.

THE DEVELOPMENT OF SECONDARY EDUCATION

Education under German (1885–1914) and Japanese (1914–44) administration did not provide for secondary schooling in the islands. The first statement of American educational policy was included in a directive of 12 December 1945: it set a pattern for education which was adapted to island living, appreciative of indigenous culture, conducted in so far as possible by native teachers and directed towards eventual self-government. The first instructions implementing this policy and establishing a uniform educational system were promulgated in May 1946. In May 1947 the present organization of a 6-year elementary school and 3-year intermediate (junior secondary) school was established.

The provision of secondary schools grew out of the plans regarding teacher training. Three levels were presented. The first was for apprentice teachers whose formal schooling in the past was scarcely equivalent to that of a 6-grade school. The second included teachers to be trained in a model intermediate school established in each district. These model schools, which opened in early 1948, taught general subjects and provided pre-professional training in teaching, medicine and nursing, and vocational training in trade, agriculture and business. The third level of teacher education was provided for selected teachers at an advanced school in Guam, designated as the Marianas Area Teacher Training School. A year later this school was moved to Truk where it became a 2-year school known as the Pacific Islands Teacher Training School.

In the meantime the trusteeship agreement between the United States of America and the United Nations Security Council had come into force on 18 July 1947, and at the end of June 1951 the administration of the Pacific Islands was transferred from the United States Navy to the United States Department of the Interior. Promulgated in 1952, the Trust Territory Code (Chapter 8: Education) now forms the legal basis of the education system. Section 565 specifically mentions that the free public school system 'shall, within the limit of funds available, consist of elementary, intermediate, professional and technical, and adult education'.

One of the first changes of policy after the transfer to the Department of the Interior was to take teacher education out of the intermediate schools and make them institutions chiefly responsible for general education and such vocational courses as agriculture and workshop training. The Pacific Islands Teacher Training School was changed to the Pacific Islands Central School (PICS) and its programme became one largely devoted to general education. It continued as a 2-year school until 1957, when the third year was added, thus completing the 12-year span of schooling in the islands.

At present each district except Rota has one public intermediate school located at the seat of district headquarters, and one district, Ponape, has a second intermediate school on the island of Kusaie. From September 1959 PICS will be housed in new buildings at Ponape. All these schools are boarding schools.

Administration. The more general aspects of policy and administration have been touched on in previous sections. Each district has two or more American teacher trainers. At least one of these trainers supervises teachers in intermediate schools, all of whom are Micronesians. The trainer's duties include improving the general and professional background of the teachers, helping to develop better programmes, teaching materials and aids, demonstrating methods and techniques.

All money expended for secondary education, including the financing of buildings and equipment and the payment of teachers' salaries, comes from grants provided by the United States Congress. The funds are allotted to each intermediate school by the District Administrator who apportions the money available for his district among the various activities. The Director of Education participates in determining the amount to be allocated for all secondary schools. No fees are charged at public schools.

The Public Works Department is charged with the responsibility of providing all buildings and equipment after consultation with the Director of Education. All new intermediate school buildings are required to be prefabricated metal buildings of rigid frame type. Because of tropical typhoons they must be able to withstand winds of a velocity of up to 125 miles per hour. New classrooms are to be 25 feet by 33 feet, allowing a minimum of 27½ square feet per pupil, 30 pupils per classroom. They will have a window area on each side of 6 feet by 33 feet, containing louvres instead of glass panes. Each room must reach a minimum standard of 12 foot candles of light.

In the matter of social welfare, intermediate school students are provided with counsel, health service and welfare benefits through the co-operation of various institutions.

TYPES OF SECONDARY EDUCATION

The district intermediate schools receive selected pupils from the various island elementary schools and provide a 3-year continuation of the general education programme of the latter. Selection is usually made by the teacher of the 6th-grade graduates from elementary school on the basis of their work. Quite often the community council has a say, in which case the son of a chief will have a better opportunity than will a child of lowly rank, a boy will be selected more often than a girl. Some district officers of education are now experimenting with tests.

From the public and private intermediate schools selected graduates go on to the Pacific Islands Central School which extends the general education curriculum for three more years and also offers a vocational programme. Here the methods of selection include a series of tests covering general knowledge of the territory, social studies, map study, English, science and mathematics. The tests have not been standardized. Recommendations of the intermediate school principal and teachers, of the American teacher supervisor of intermediate teachers, and in some districts of a scholarship committee are also taken into consideration.

The only type of further education in the islands open to the senior secondary school leaver is adult education. Scholarships are given every year, however, to selected students for two years of undergraduate study outside the Territory, usually in Hawaii. Another scholarship is granted to selected students who have completed this 2-year programme, enabling them to pursue undergraduate studies, including professional courses.

The opening of school, the school calendar and the school term are all matters for the educational authorities of each district to determine. So long as children are in school for 180 days per year, the district can plan its school programme so as to fit in with local activities, e.g., cash crop seasons. Assurance of regular attendance is a condition for entry to schools.

Curricula and methods. The development of the intermediate curriculum at the district level is a continuous process. In general it centres on a core of social studies through which students come to understand their own institutions, problems related to their economic welfare, their geographical environment and its effect upon their way of life, the historical background from which their society has evolved, and something about the outside world. Students take up as class projects consideration of the problems faced by local and district officials in the running of political affairs. More stress is placed upon the teaching of English as a second language, though it is not employed at the expense of the native languages. General arithmetic is related to problems of daily living. In health education a better understanding of personal, home, and community health and sanitation problems is taught. Science is integrated with social studies, agriculture and health education. Vocational programmes vary from one intermediate school to another: at one school, for example, seventh graders learn the correct usage of tools, and make clothes chests and other simple items needed in their dormitories or at home; eighth graders learn to draw house-building plans and to construct house frames, and ninth graders learn to draw boat-building plans and to construct boats. With the exception of classes in English, the pupils in intermediate schools are not grouped by ability or aptitude.

The programme at the Pacific Islands Central School is planned to broaden educational background, as well as to give some special training to provide potential leadership for Micronesian communities and districts. In the 'core' classes students study the needs and problems of Micronesia. They develop better understanding of how resources, work, wages and ways of life depend upon environment. Health education is continued. Increased emphasis is given to the subject of government, beginning at the family level and progressing to the community or village, island or atoll, the district, the Trust Territory and the world, including the United Nations. The teaching of science is integrated as much as possible with agriculture.

The core class, which is scheduled for two or more of the usual class periods, is the most important class in the intermediate schools and at PICS, especially during the first year, for this is where the student first learns to understand his classmates who come from different islands, and, in the case of PICS, speak different languages and belong to different cultures. It is also where the student establishes the greatest rapport with his teacher; the core teacher is his guide and counsellor for the year.

Achievement testing and reporting. No standardized achievement tests are given except as a method of selection of scholarship students. Because of divergent cultures each district is developing its own testing and evaluation procedures. Report cards are issued quarterly in some districts and twice a year in others.

Since the intermediate schools and the Pacific Islands Central School are fairly selective, most students who enter each level are automatically promoted unless they show complete lack of ability or interest or are otherwise maladjusted to the secondary school environment. Once a student is promoted to the second year, it is unusual for him not to graduate.

Teaching staff. In intermediate schools all the teachers are Micronesians. They are supervised by an American who guides and counsels them in teaching methods, classroom management, curriculum development, preparation and use of teaching materials, preparation and use of evaluation techniques and on all other aspects of a good educational programme. Intermediate school teachers are recruited from among successful elementary school teachers, graduates of the Pacific Islands Central School and scholarship students who have had two years of higher education in Hawaii.

At the Pacific Islands Central School the teachers are Americans but Micronesians are now being trained and will be fully prepared to take over in a few years' time.

Vocational and technical schools. Both vocational and general

education are integral parts of the curriculum in intermediate schools and the Pacific Islands Central School. In Palau there is a nursing school at secondary level, offering 20 months' basic training. Successful students are given certificates of graduation.

Teacher training schools. There is an education class at the Pacific Islands Central School but most teacher education is carried out in post-secondary district sessions providing practice training, oriented to the special needs of the district.

Out-of-class activities. The students elect officers for their classes and also choose representatives on the student council, which holds formal meetings and takes part in drafting most of the school rules. Great importance is attached to these activities as a means of helping Micronesians to learn self-government.

Since all secondary schools are boarding schools, social life cannot be neglected. Various activities are organized by the school government and supervised by teachers: appropriate movies and in some schools dances, school sports and games, photography clubs, music clubs, science clubs, agriculture clubs, etc. These activities can be considered as much a part of the curriculum of the secondary schools as are the regular classroom activities.

TRENDS AND PROBLEMS

Up to the present, each district intermediate school staff has developed its own curriculum content, teaching materials, time allotment and goals in accordance with general guide lines given in an Education Development manual. The Department is now turning its attention to the preparation of curriculum plans suitable for all intermediate schools but flexible enough to allow modifications to meet local needs, and to the building up in each school of a library of appropriate materials for teachers.

Curriculum revision and development of relevant teaching material are also needed at the Pacific Islands Central School, taking greater cognizance of goals to be achieved and content to be covered. Plans have been made for this work to begin in 1959. With the transfer of the school to its new site at Ponape, vocational education will be extended and improved, particularly workshop training and agriculture. Training in the domestic arts needs greater emphasis throughout the secondary programme.

Educators in the Trust Territory believe that the secondary schools should develop abilities which will help individuals function better as members of their social group. Granting that there are features of American and world culture the acquisition of which would benefit the Micronesians, it is not desirable or possible for them to substitute those of another people for their own ideas, beliefs, skills, arts and crafts, methods of thinking, customs and institutions. What can and should be done is to help them to evaluate other cultures and accept into their own what is adaptable and usable. It is the function of the secondary schools to help Micronesians to achieve this cultural synthesis.

STATISTICS

Population (mid-year 1958 estimate): 71,000.
Dry land area: 687 square miles; 1,779 square kilometres.
Population density: 103 per square mile; 40 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment exclusive of adult education was over 13,000, representing 19 per cent of the total population. As compared with 1954/55, enrolment had increased by 50 per cent.

In 1956/57, the proportion of girls among primary pupils was 47 per cent and among secondary pupils 34 per cent. In the same year the pupil-teacher ratio was 25 in the elementary schools and 12 in the schools of secondary education. (See Table 1.)

Enrolment trends in secondary education, 1950–57. The ratios obtained by relating the enrolment in general secondary education (averages for 1950–54 and for 1955–57) to the estimated population 15–19 years old are shown in Table 2.

Examination results in secondary education, 1953–57. During the school year 1957/58, the certificate of graduation from intermediate schools was granted to 338 pupils, of whom 127 were female. For 1953/54, the corresponding figures were 261 and 99. The proportion of girls in schools of secondary education changed very little from 1953/54 to 1957/58; nevertheless, certificates granted to girls, expressed as a percentage of the total number of certificates granted, increased during this same period from 18 to 38 per cent. The certificate of graduation from vocational school was obtained by 2 pupils in 1954/55, by 8 in 1955/56 and by 15 in 1956/57.

Educational finance, 1957/58. In the fiscal year beginning July 1957, total expenditure on education was almost double that of 1954/55. These amounts represent an average expenditure of $13 per inhabitant for 1957/58 and $7.5 for 1954/55. There was also an increase in the average cost per pupil—from $50 per pupil in 1954/55 to slightly less than $70 in 1957/58. (See Table 3.)

RYUKYU ISLANDS

THE EDUCATIONAL SYSTEM

After the reform of the Japanese educational system in March 1948 the same pattern of schooling was adopted for the Ryukyu Islands: six years of primary education (elementary school), three years of lower secondary education (junior high school), three years of upper secondary education (senior high school), and four years of higher education; the period of compulsory school attendance covers the first nine years of this course.

The only higher education available in the Ryukyus is provided at the University of the Ryukyus, founded in 1950, and at Okinawa Junior College, founded in 1958.

There are a number of kindergartens run by private organizations and by local agencies, without government subsidies, and special schools for the handicapped.

The Code of Education for the Ryukyus expressly stipulates that all education must be based on the universal principles of mankind, must encourage a love of truth and peace and a respect for the value of the individual, and must aim at producing men and women who will contribute to the building of a democratic and cultured society.

Within the constituted Government of the Ryukyus is a Department of Education with a Director of Education appointed by the Chief Executive.

A Central Board of Education, indirectly elected by the people through a caucus of members of local district boards of education, sets the broad policies for education within

the framework of laws, and is the governing board over government vocational high schools, schools for the handicapped, and government museums and libraries.

Public elementary and junior high schools are operated by 63 local school boards, members of which are elected by the people in their respective areas. Public senior high schools are operated by 14 'union districts', each of which is formed by the combination of several local districts; each local board is represented by one member on the board of the union district to which it belongs. Each union district employs a superintendent of education who is responsible for the administration of all public schools (elementary, lower and upper secondary) within the union area. To defray the expenses of the superintendent's office each local district in the union is responsible for a proportional share of the costs.

Parent-teacher associations have been organized in each district and in each school. These have played an important part in post-war education in the Ryukyus, particularly in the reconstruction of school facilities.

The inhabitants of the Ryukyu Islands have the same ethnic, cultural and religious background as the Japanese people and Japanese has been the common language of the islands for almost a century. The textbooks, curricula and courses of study current in Japan are used in the islands and Japanese instructors assist in the pre-service and in-service training of teachers.

THE DEVELOPMENT OF SECONDARY EDUCATION

Educational events from the turn of the century until the termination of World War II were identical with those in Japan.

With the cessation of hostilities an advisory council of leading Ryukyuans was established to assist the United States Military Forces provide aid to the local population and to advise on carrying out the functions of civil government. Within this council was a department of educational affairs. A few months later, in January 1946, by instruction of the United States Navy Military Government, a Department of Education was organized.

In March 1947 it was decided that eight years of elementary education would be made compulsory, a 4-year secondary school organization was mapped out, teachers were appointed, and full scale education resumed. At the same time vocational senior high schools were established to offer education at the secondary level for working youth. These vocational schools were abolished after one year of operation. One year later, following the educational reform in Japan, the 6-3-3-4 organization was adopted. In the spirit of equality of educational opportunity, upper secondary schools were decentralized where heretofore they had been operated only in urban areas.

In 1952 the Government of the Ryukyus was founded, with a central Department of Education. The educational system of the entire island chain was unified and on 28 February 1953 the Code of Education for the Ryukyu Islands was promulgated as Civil Administration Ordinance No. 66. The ordinance provided for the Central Board of Education and the local and union district boards of education already mentioned; thus the control and execution of educational administration were conducted through boards elected by the people. Provision was also made for fiscal independence of the districts by empowering the boards of education to levy an educational tax and to manage their own financial affairs. Although governmental subsidies remained a major source of educational support, local autonomy in the administration of the budget was assured.

Civil Administration Ordinance No. 66 was replaced by Civil Administration Ordinance No. 165 in March 1957. Certain provisions of the new ordinance which prohibited political activities by teachers, restricted official travel, placed employment of teachers on a contractual basis, and limited the time that a school principal could serve to a single term of five years in any one school and to ten years in total, were severely criticized by the teachers and there was agitation for the passage of local educational legislation.

In September 1957 four education laws closely patterned on corresponding laws in Japan were passed by the Legislature and became effective on 1 April 1958: the Basic Code of Education, the Board of Education Law, the School Education Law, and the Social Education Law. Ordinance No. 165 was rescinded with the exception of that portion that pertained to the University of the Ryukyus. In September 1958 two additional laws were passed by the Legislature, the Certification Law, and the Enforcement Law for the Certification Law, establishing qualifications for the certification of teachers and other educational personnel.

Administration

The principal functions of the Central Board of Education and of union and local district school boards have already been mentioned.

The Central Board also sets curriculum standards, authorizes textbooks for use in schools, and establishes standards and regulations to implement educational laws. Both local and union district boards are juridical bodies empowered to buy and sell school properties, to employ teachers and other employees of the school district, to set up local educational policies which are consistent with the regulations, standards and policies of the Central Board of Education and, with the approval of the Central Board of Education, to set up curriculum standards and to establish or abolish schools and other educational institutions.

Teachers of schools and educational institutions run by the Central Government are entitled to all the rights of civil servants, and are in a different category from those employed by local and union school districts. At the present time, neither central government employees nor local public personnel have a pensions system, but legislation to remedy this is under consideration.

The Director of Education exercises ministerial functions, advises on all educational matters administered by the Central Board and serves as the secretary and administrator of that body, conducts educational surveys and investigations, and makes recommendations to the board on matters which, in his opinion, are conducive to the improvement of education.

The Department of Education is a service agency for all

schools. Within the department are teacher-consultants and social education directors who give advice and counsel but exercise no direct control.

Each superintendent of education is the chief administrator of his employing board. His staff includes teacher-consultants and social education directors who serve all schools within the union district.

An Education Council advises the Chief Executive on educational matters, but has no administrative functions.

Finance. The support of education comes from tax revenues at both central government and local levels; from parent-teacher association fees and other local sources, such as donations from individuals, organizations and business firms; and from grants from the United States Civil Administration of the Ryukyu Islands.

Buildings and equipment. The law provides that the Government shall be responsible for the full cost of construction of school buildings, and may provide subsidies to school districts for equipment and teaching materials within the limits of the budget.

The minimum building allocation for junior high school students is fixed at 2 square metres per student.

In the senior high schools the minimum standard is 3.3 square metres per student enrolled in the academic courses and in commercial and homemaking vocational courses, and 4 square metres per student in other vocational courses. From the date of establishment of the regulations in May 1958 schools are allowed a 5-year period to comply with the minimum standards.

In art rooms, libraries and sewing-rooms the blackboards are required to have 100–200 luxes of lighting; in other classrooms and laboratories the requirement is 50–100 luxes.

School welfare services. Through the assistance of the United States Civil Administration of the Ryukyus Islands and American Welfare Agencies, one daily serving of milk is provided without cost to each school child. Under a similar programme, students attending evening courses, and going directly to the school from their place of employment, are provided with a hot meal.

Each child receives at least one free medical examination annually.

TYPES OF SECONDARY EDUCATION

The 6-3-3 system took effect on 1 April 1948 and the elementary school, junior high school and senior high school were unified into a single system.

The school year starts on 1 April and is divided into three terms—1 April to 31 August, 1 September to 31 December, and 1 January to 31 March. Instruction is not given on Sundays or on statutory holidays. Vacations are taken from 21 July to 31 August, from 25 December to 5 January, and from 25 March to 31 March. Schools are in session five and a half days a week and for at least 210 days each year. Class periods are usually of 50 minutes' duration with 10-minute intervals between classes.

General secondary schools

Junior high schools. The curricula are the same in urban and rural areas except for vocational and home economics courses which are modified according to the special requirements of the various localities. In some remote areas junior high schools are operated in combination with the elementary school. There is also a combined elementary and junior high school for the blind and deaf, and two combined schools for children suffering from leprosy. These are government schools and are established and governed by the Central Board of Education.

The basic subjects in the junior high school course and the number of 50-minute periods devoted to each subject per week are the same for each of the three years of study and are as follows: Japanese 5, social studies 4, mathematics 4, science 4, music 2, drawing and handicrafts 2, health and physical education 3, vocation and homemaking 3, English 3. Other subjects and activities bring the total number of periods per week up to 35 and the number per year of 35 weeks to 1,225.

Senior high schools. Pupils eligible to seek admission to senior high schools are graduates of junior high schools or schools corresponding thereto, or those who are recognized by the Central Board as having equivalent qualifications. Teachers of junior high schools and teacher-consultants serving in superintendents' offices or in the Department of Education guide students in the selection of their courses in the senior high schools. Standardized aptitude tests are administered annually to all third year pupils at junior high schools. Selection is based on the results of an entrance examination, administered simultaneously to all candidates in the Ryukyus, and on the record of the pupil for his three years in the lower secondary school, and is in accordance with the regulations of the school board which controls the upper secondary school. The number of pupils admitted to senior high school each year is about 60 per cent of the candidates and 50 per cent of the graduates of the junior high schools.

The upper secondary level is divided into the general course and the vocational course. The former is primarily designed for those intending to advance to institutions of higher education and the latter for those for whom it is anticipated that secondary education will be terminal (it will be referred to again under the section 'Vocational and technical schools'). Each of these courses may be taken either as a full-time course or a part-time course. The former is of 3 years' duration, while the latter is designed to meet the needs of the working youth who can only attend night courses, and requires 4 years attendance to cover the same curriculum as that provided by the daytime course.

The following subjects are required of all students: Japanese, mathematics (for one year), health and physical education, civics; any two of the following—Japanese history, world history, geography; and two science subjects (out of physics, chemistry, biology, geology). In addition, pupils taking the full-time general course must select a number of subjects (making up six credits[1]) from among arts, homemaking and vocational subjects, while those tak-

1. One credit equals one hour per week per year. Thus a subject for which the time-table provides three periods per week would, if taken for a year, give three credits.

ing the vocational course (including full-time and part-time courses) must take at least 36 credits in vocational subjects.

The minimum number of credits required for graduation is 85.

Teachers. At the present time the only teacher training institution in the Ryukyus is the University of the Ryukyus. However, many Ryukyuans attend Japanese universities and colleges and, on return to the islands, are employed locally. Teachers can get a temporary certificate based on one year of university attendance and a second class regular certificate based on two years of university training; for a first class regular certificate a degree is required and two years of certified successful teaching experience.

The University of the Ryukyus Extension Department offers training courses during vacation periods and correspondence courses. The Central Board of Education also operates training courses for teachers wishing to up-grade their certificates.

Out-of-class activities

All high schools have student organizations—the Student Council, which discusses and solves various student problems for the school as a whole, and the class student bodies, which deal with similar matters at class level. Students share among themselves functions belonging to school management that are related to their own welfare. Each school in the Ryukyus has a number of clubs for pupils interested in various cultural and sporting activities and each club conducts its activities under the guidance of a teacher.

Vocational and technical schools

Vocational education in general secondary schools. In the vocational and home economics courses of the junior high school emphasis is placed on understanding the social and economic aspects of industry, manual labour, and home life, and the acquisition of fundamental skills, etc., the main object being to provide a broad training in vocational subjects rather than to prepare the student for a particular occupation.

In addition to offering the general academic course which is primarily designed to meet entrance requirements for higher schools, public senior high schools may offer complete vocational courses to meet the same requirements as the courses offered in the specialized vocational and technical high schools, or they may offer individual subjects from the several vocational courses to meet the requirements of the local community.

Every public senior high school offers the general vocational course. At the present time, because of the lack of vocational equipment, the basic requirements of this course are almost the same as those for the general commerce course. In addition, each school offers elective subjects from other vocational courses, i.e., four senior high schools offer agricultural subjects and four, auto mechanics. Each senior high school also offers the home economics course for girls.

Agricultural high schools. The aim is to train agricultural technicians and skilled workers, and to prepare leaders who can develop the resources of the countries to which they may emigrate. The curriculum includes general and vocational subjects. Two hours a week are allotted to home projects, and through the Future Farmers of Okinawa (FFO) Club, skills learned at school are applied to the improvement of agriculture in the local community. The FFO holds a general meeting each year, in which technical contests, demonstrations, livestock judging contests, etc., are held.

Technical high schools. Technical education at secondary level is concerned with training the skilled workers who are to become a driving force for the improvement of industry in the Ryukyus. It aims at providing pupils with fundamental knowledge and skills based on actual shop practice. Students of the third year class are assigned to factories for on-the-job training for 10 days during summer and winter vacations.

Fishery high schools. These schools inculcate a knowledge of fishing and of the processing of marine products, fish propagation, marine engines, and radio communication. Third year students receive practical training for from two to three months on a boat owned by the school.

Commercial high schools. The course includes general and vocational subjects and trains pupils to be speedy and accurate in book-keeping, abacus work, and typing. Students are sent to commercial firms and to government offices for practical training periods of 20 days during summer vacations and 5 days during winter vacations.

Miscellaneous schools. This title is used to cover a great variety of private schools open to junior high school graduates or pupils of equivalent status, and providing various types of course ranging from one to two years. Most of them teach English and such vocational subjects as dressmaking, hairdressing, typewriting and cooking. They are all established with the approval of the Central Board of Education.

TRENDS AND PROBLEMS

Educational problems in the Ryukyus today are mainly of the type found in a period of reconstruction. The improvement of secondary education is closely related to the provision of more accommodation and equipment, the raising of teachers' qualifications and the establishment of better conditions of service. Although 30 per cent of the government budget is already devoted to education, the major problem is still one of finance.

A survey, carried out on 1 July 1958, of the junior high school graduates of 1 April 1957 gave the following result: number of graduates, 15,716; enrolled at higher schools, 50 per cent; gainfully employed, 35 per cent; unemployed, 12 per cent; unknown, 3.5 per cent. These figures show the necessity for providing two types of education—one for those who plan to go on to higher schools and the other for those who take up occupations. Up to now emphasis has been on providing for the former, at the expense of the latter.

Special needs in junior high school education are more facilities and equipment for vocational and homemaking courses, and improvement of the qualifications of the teachers in charge of these courses. Vocational and educational guidance services need to be developed and more attention given to moral education and guidance in daily living.

As regards upper secondary education, a survey of graduates from senior high schools in 1958 showed that of the 4,304 students who completed regular courses in local authority schools (mainly general education) 25 per cent enrolled in higher institutions, 32 per cent entered employment, 28 per cent were at the time unemployed, while the situation of the remainder was not known. In the same year 1,852 students completed regular courses in government senior high schools (vocational courses only); 11 per cent went on to higher education, 78 per cent into employment, 3 per cent were unemployed and no information was available on the remainder.

In the general course at senior high schools emphasis is being placed on increasing educational and vocational guidance and on strengthening moral education. On the vocational side, a 5-year promotion programme was begun in 1958 with the co-operation of the United States Civil Administration of the Ryukyu Islands. This plan involves the expenditure of $1.8 million for vocational equipment and approximately $1.5 million for the construction of workshops and special classrooms and for the training of vocational teachers. In vocational courses emphasis is placed on the acquisition of actual skills rather than the memorization of theory.

One of the special considerations in upper secondary education is the need to train persons who can contribute to the economy of the Ryukyus, in conformity with the Government's economic development programme.

STATISTICS

Population (mid-year 1958 estimate): 838,000.
Area: 848 square miles; 2,196 square kilometres.
Population density: 988 per square mile; 382 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including vocational courses for adults) was about 253,000 pupils, representing 31 per cent of the total population. The proportion of girls was 49 per cent in primary schools, 48 per cent in junior and senior high schools, 30 per cent in vocational schools, and 25 per cent at the university. Women teachers were 66 per cent of the teaching staff in primary schools, where the average number of pupils per teacher was 41 in 1957/58 as compared with 32 in 1953/54. Between 1953 and 1957, total pupil enrolment increased by 40 per cent, although enrolment in public junior and senior high schools decreased by 4 per cent. (See Table 1.)

Enrolment trends in secondary education, 1933–57. Data shown in Table 2 are not comparable between the periods 1933–40 and 1948–57, since they refer to different systems of school organization. Between 1948 and 1957, enrolment in general secondary education, public schools only, increased by nearly 30 per cent and in vocational schools the increase was almost threefold. Teacher training has been provided by the university since 1953. Average total enrolment in public secondary schools for the period 1955–57 represented 83 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–57. Between 1953 and 1957, the number of junior and senior high school diplomas increased by 24 per cent and 45 per cent respectively; the number of vocational high school diplomas more than tripled. Girls received 48 and 46 per cent of the junior and senior high school diplomas in 1957/58, but only 18 per cent of the vocational school diplomas. (See Table 4.)

Educational finance, 1956–57. For the fiscal year beginning in July 1956, total expenditure on education amounted to 6.4 million U.S. dollars, averaging about $8 per inhabitant. The Central Government provided 84 per cent of the total receipts for education, and the local authorities 8 per cent. Recurring expenditure was about 72 per cent of the total. (See Table 3.)

URUGUAY

THE EDUCATIONAL SYSTEM

The general principles governing education in Uruguay are laid down in the following articles of Section II, Chapter II, of the Constitution of 26 October 1951:

Article 68. 'Freedom of education is guaranteed. The law shall provide for State intervention only in so far as it may be required for the maintenance of health, good morals and public security and order. Every parent or guardian shall be entitled to select the teachers or institutions he wishes for the education of his children or wards.'

Article 69. 'Private educational institutions which provide free education for such number of pupils and in such form as may be determined by law, and cultural institutions, shall be exempt from national and municipal taxes as a subsidy for their services.'

Article 70. 'Primary education shall be compulsory. The State shall make the necessary provision to enforce this requirement.'

Article 71. 'Free official primary, secondary, higher, vocational, technical and artistic education, and physical training; the establishment of scholarships for further study and specialization in the cultural, scientific and industrial fields; and the establishment of public libraries, are recognized to be in the public interest. Special attention shall be paid, in all educational establishments, to moral and civic training.'

The organization of the educational system is laid down in the following articles of Section XI, Chapter II:

Article 204. 'Public higher, secondary and primary education, teacher training, vocational, technical and artistic education shall be administered by one or more autonomous councils.

'Other state educational services shall also be administered by autonomous councils when so determined by the Legislature on a two-thirds majority vote of all members of each House.

'For the preparation of laws relating to their services, the public education authorities shall be heard, in an advisory capacity, by the Parliamentary Commissions . . .'

Article 205. 'The councils administering the educational services shall be appointed or elected in such manner as may be established by a Law passed by an absolute majority of the votes of all members of each House.'

The procedures governing the duties and functions of the councils are set forth in the next two articles (Nos. 206 and 207).

The distinguishing features of education in Uruguay at all levels—from kindergarten to the end of the university degree course, and including general, vocational, technical, artistic and physical education—can be summarized as follows: all education provided by the State is completely free of charge; there is complete equality of access to education, irrespective of race, sex, religion or class; state-provided education is secular; freedom of education is guaranteed, except at the university level, where the University of the Republic alone is entitled to confer university degrees; primary education is compulsory.

The structure of the Uruguayan school system is shown in the diagram on page 1437.

Role of the public authorities

The administration of education is vested in the Consejo Nacional de Enseñanza Primaria y Normal (National Council for Primary Education and Teacher Training), the

Consejo Nacional de Enseñanza Secundaria y Preparatoria (National Council for Secondary and Preparatory Education), and the Universidad del Trabajo (Council for Vocational and Industrial Education), autonomous councils which operate under the auspices of the central Ministry of Public Education and Social Welfare.

The University of the Republic used to be administered by the University Council but acquired full independence under a recent Organic Law.

The Ministry's authority is mainly political; in technical matters, the various councils have considerable independence, though they endeavour to harmonize and coordinate their activities.

In addition to the schools, administered by the various councils, there are official educational establishments coming directly under the Ministry. They are the Escuela Nacional de Bellas Artes (National School of Fine Arts), and the Conservatorio Nacional de Música (National School of Music) which operates in association with SODRE (Servicio Oficial de Difusión Radioeléctrica), the official broadcasting service. At the local level, Montevideo also has a Municipal School of Dramatic Art and a Municipal School of Music, both of which are responsible to commissions of the capital's Departmental Council.

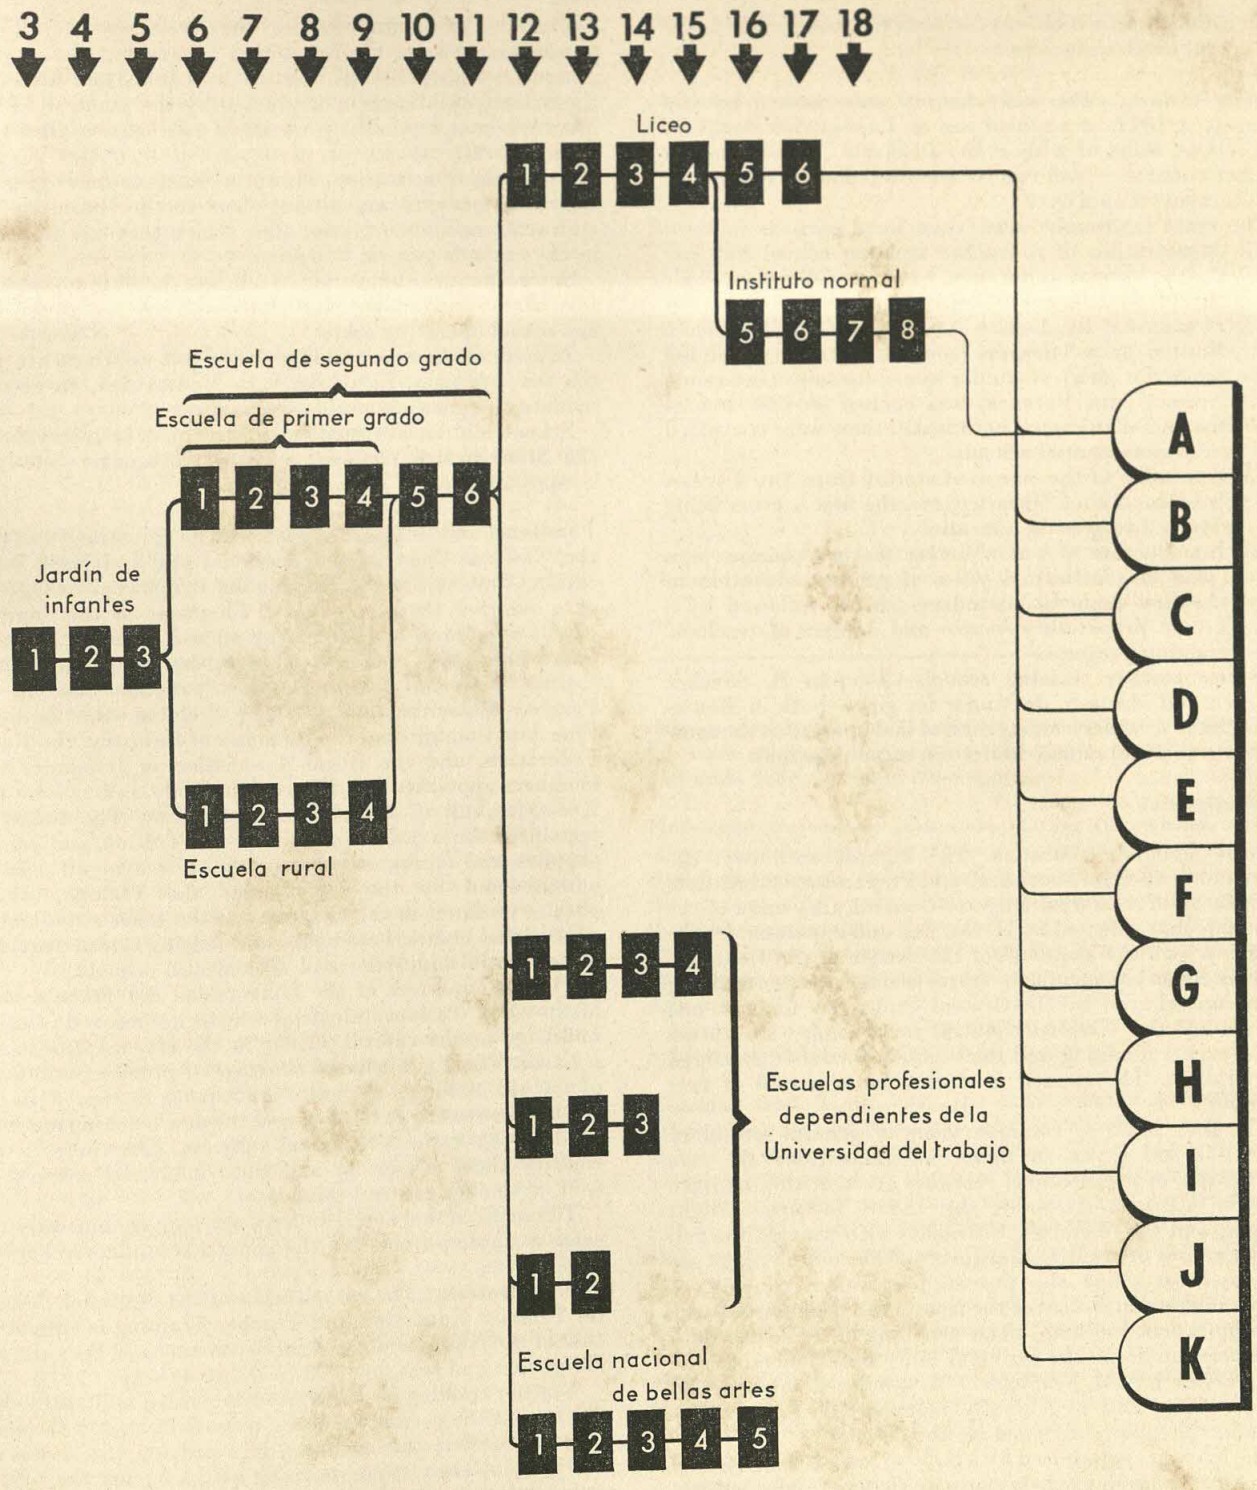
THE DEVELOPMENT OF SECONDARY EDUCATION

In Uruguay, there are three main types of secondary education: general secondary education, secondary-level vocational and technical education, and teacher training. Each of these three branches is quite separate from the others and has its own history.

General secondary education. The history of general secondary education falls into four periods:

1. From 1830 (the date of the first Constitution of the Republic) to 1885. During this period secondary education was academic and restricted to the upper classes of society.
2. From 14 July 1885 (promulgation of the law of Doctor Alfredo Vázques Acevedo) to 1911. This law set forth the aims of secondary education, which none the less remained essentially selective and academic.
3. From 1911 to 1935. This period saw the organization of general secondary schooling in two cycles (a basic 4-year course taken by all pupils followed by two years of specialization), the adoption of the principle of free provision of education, the establishment of provincial general secondary schools (*liceos departamentales*), the Women's University and the Night Secondary School (*Liceo Nocturno*), and the introduction of the system of promotion without examination for pupils who achieve a satisfactory standard in their work.
4. From 1935 to the present. Under the Organic Law of 1935 general secondary education became an autonomous branch of the educational system. The law established the National Council for Secondary and Preparatory Education in its present form, and provided for the participation of the teaching body in the administration of education.

Vocational and technical education. The principal events have been as follows:



1879. Adoption of a law authorizing the Executive to draw up plans and regulations for craft training schools (*escuelas-talleres de artes y oficios*) on the European and United States pattern but adapted to local conditions. This law was to govern the activities of the trade instructors employed by the State to teach young delinquents, orphans, etc., in makeshift premises.
1915. Establishment of the Higher Council for Industrial Education (Consejo Superior de Enseñanza Industrial).
1916. Beginning of regularly organized courses, which included both artistic and industrial education.
1917. Division of vocational schools into three main types: building, mechanical and electrical engineering, and women's trades.
1934. Establishment of the Directorate-General of Industrial Education.
1942. Establishment of the Universidad del Trabajo del Uruguay (Council for Vocational and Industrial

GLOSSARY

escuela nacional de bellas artes: vocational training school of fine arts.
escuela de primer grado: incomplete urban primary school.
escuela rural: rural primary school.
escuela de segundo grado: complete primary school.
escuelas profesionales dependientes de la Universidad del Trabajo: vocational training schools of various types (agriculture, arts and crafts, building trades, commerce, mechanical and electrical trades, manual crafts for women, etc.) administered by the *Universidad del Trabajo*, an autonomous body responsible for vocational education throughout the country. Some of the schools also have courses at post-secondary level.
instituto normal: teacher training school.
jardín de infantes: pre-primary school.
liceo: general secondary school.

HIGHER EDUCATION

A. *Instituto de profesores:* teacher training college for secondary school teachers.
B. *Agronomía:* agriculture.
C. *Arquitectura:* architecture.
D. *Derecho y ciencias sociales:* law and social sciences.
E. *Ciencias económicas:* economics.
F. *Medicina:* medicine.
G. *Ingeniería:* engineering.
H. *Odontología:* dentistry.
I. *Química y farmacia:* chemistry and pharmacy.
J. *Veterinaria:* veterinary science.
K. *Humanidades y ciencias:* arts and sciences.

Education) which was declared an autonomous body in the following year.

Teacher training. The early history was marked by the opening, in 1827, of a school run on Lancastrian methods, and, about 1850, of a short-lived Colegio Nacional and a teacher training school run by the Sociedad de Amigos de la Educación Popular.

The main landmarks since then have been as follows:

1877. Organization of a teacher training school by José Pedro Varela under the General Education Law (*Ley de la Educación Común*), Article 7.
1882. Foundation by Jacoba A. Varela of the Internado Normal para Señoritas (residential teacher training school for girls). A similar school for boys (Internado Normal para Varones) was opened in 1900 but at the end of that year both institutions were converted to non-residential schools.
1913. Extension of the course of studies from 3 to 4 years.
1939. Introduction of 7-year course, the first 4 years being devoted to general education.
1955. Introduction of a new 8-year teacher training plan (*plan magisterial*): 4 years of general education at the *liceo* (general secondary school), followed by a 1-year preparatory course and 3 years of teachers' training progress.

The two teacher training schools—Joaquín R. Sánchez for men and María S. de Munar for girls—both in Montevideo, have now been amalgamated and operate in the same premises in Montevideo, under the same principal.

Administration

General secondary education. The highest authority, the National Council for Secondary and Preparatory Education, is made up of a salaried Director-General, Chairman of the Council, who is elected by the council and appointed by the Ministry with the approval of the Senate of the Republic, and six honorary members—three elected by the teaching body, one elected by the Central University Council, one elected by the National Council for Primary Education and Teacher Training and one elected by the Universidad del Trabajo. The council is elected for a period of four years.

The four basic or common years of general secondary education are given in *liceos*. In Montevideo the two specialized, or preparatory, years are given at the Instituto Alfredo Vázquez Acevedo; the Liceo Nocturno (Night School) and the Women's University also provide the full 6-year course of studies. Elsewhere in the country there are various *liceos* which also provide preparatory courses.

The highest authority of the *liceo* is the headmaster, who sometimes has the help of an assistant headmaster, both being chosen from the national body of teachers on the basis of merit; the headmaster is appointed for a period of four years and is generally reappointed. *Liceos* enjoy considerable autonomy *vis-à-vis* the council.

The *liceos* are supervised by a body of inspectors recruited from the ranks of teachers; private *liceos* are also subject to inspection and must follow the official curricula, but are allowed some freedom in the choice of certain textbooks and the recruitment of teachers. Private *liceos* must be approved (*habilitados*) before they can operate. Their pupils benefit from the promotion system but the examination for which they sit must be held in a State *instituto*; the examination may be conducted by the teachers of the private school, but in the presence of a delegate of the State school.

Under the Constitution, the autonomous councils prepare their own budgets and submit them to the Executive for approval, amendment, etc., after which they are included in the nation's general budget.

Since secondary education in official schools is completely free, there is no student contribution of any sort to secondary school operating costs.

In spite of the new buildings being put up, there are still too few premises, particularly in Montevideo, to accommodate the growing student population.

Schoolchildren are medically examined at intervals by the State health services; vaccination against smallpox is compulsory.

Vocational and technical education. The governing body of the National Council for Vocational and Industrial Education (Universidad del Trabajo del Uruguay) is composed of a salaried Director-General, Chairman of the Council, who is appointed by the Executive, and an administrative board consisting of honorary members delegated by the Central University Council, the National Council for Primary Education and Teacher Training, the National Fine Arts Commission, the Chamber of Industry, the Rural Federation, and the Rural Association of Uruguay, two members appointed by the teaching body and two by the Executive, all of these being specialists. The board is appointed for a period of four years. Tuition and school supplies and equipment are provided free in all schools administered by the Universidad del Trabajo, which obtains its funds in the same way as the other autonomous educational bodies. Free board and lodging is also provided in residential industrial and agricultural schools.

The headquarters of the Universidad del Trabajo is in Montevideo. Various industrial schools are located in other buildings in the capital, either in the city itself or in the suburbs. There is a general shortage of premises and most of the old buildings are quite inadequate to cope with the steadily increasing enrolment and the new teaching methods used in the various technical subjects. Elsewhere in the country there are urban and rural industrial schools, as well as the agricultural schools.

The medical and social welfare services are basically the same as those provided in the general secondary schools.

Teacher training. The composition of the National Council for Primary Education and Teacher Training is similar to that of the National Council for Secondary and Preparatory Education and it is financed in the same way.

Teacher training by the State is provided in Montevideo. Because of the need of teachers, private institutes throughout the country are authorized to provide the necessary instruction, their students being prepared for the official examinations.

Students at teacher training schools enjoy the same privileges and medical and social welfare services as do those in the other branches of official education.

TYPES OF SECONDARY EDUCATION

The average age-range of students in all three main types of school at secondary level (general, vocational and teacher training) is the same (11 to 18 years). Admission to the university, however, can be gained only through the general secondary schools. The vocational education provided by the Universidad del Trabajo does not qualify students for admission to any faculty, while certificated teachers must take the preparatory course (upper cycle of general secondary course), although the equivalence of certain subjects may be recognized, before they can enter the university.

There are other establishments of a similar level, like the National School of Fine Arts, the National School of Music, the municipal schools of dramatic art, etc., which do not qualify for admission to the university.

The school year in Uruguay runs from the beginning or middle of March to November-December. Some agricultural schools adapt their time-tables so as to fit in with the seasonal aspects of farming. In general secondary and teacher training schools the examination periods for the various courses are November-December, February, May or July.

The school year is generally divided into three terms. Apart from the summer holidays (January and February), a week is given at Easter, two weeks in July and, nearly always, three to six days of spring holiday in September.

General secondary schools

The aims of general secondary education are laid down in Article 2 of the Organic Law on Secondary Education in the following terms: 'The essential aim of secondary education shall be to provide the students with a complete and rounded culture. The endeavour shall be to produce citizens who are aware of their duties to society . . . it shall be a continuation of primary education, leading on to higher education.'

Pupils who have completed six years of primary education in public schools can go straight on to the *liceo* provided that their average school marks are sufficiently high; if not, they must sit for an entrance examination. Pupils from private schools must take the entrance examination, in any case, at an official *liceo*. Entrance examinations are held simultaneously throughout the country and all pupils have the same examination papers, set by the council, in mathematics, Spanish, history and geography. For those who pass the written examination, admission to the *liceo* is automatic; if a pupil fails in some papers he is given an additional oral test in the subject or subjects concerned.

There is no fixed age-limit for admission to the *liceos* but the usual age of entrants is 12 years.

The different class teachers meet every three months and the average grading of each student is worked out from his or her marks in each subject. At the third and last meeting (which in the private *liceos* is presided over by a secondary education inspector) the average for the student's work over the whole year is calculated; if the average is up to a specified level the pupil is promoted to the next class above without examination. If it is below that level, the pupil must take an examination in each of his weak subjects; if it is quite inadequate, he is eliminated and must take the same class again.

University preparatory education. During the second cycle of general secondary education, i.e., the last two years of study, the subjects vary according to the faculty for which the student is preparing. There are preparatory courses for the following faculties: Law and Social Sciences, Notarial Studies, Medicine, Dentistry, Veterinary Science, Chemistry and Pharmacy, Engineering and Surveying, Architecture, Agronomy, Economics and Administration.

Class hours average 25 a week, while the number of subjects studied each year ranges from 5 to 8.

Teaching staff. Until 1949 the only method of training teachers for general secondary schools in Uruguay was that known as the *sistema de agregaturas*. Under this system, young people who had obtained their *bachillerato* (general secondary leaving certificate) were attached for training to a qualified teacher who guided, supervised and appraised their work in association with the inspector for the subject concerned.

To replace this system, the Instituto de Profesores de Enseñanza Secundaria (training school for secondary teachers) was set up under Article 49 of the Law of 2 July 1949. In the following year its name was changed to Instituto de Profesores Artigas. A commission appointed by the council submitted draft regulations in 1949 and a study plan in 1950.

Admission to the institute is subject to certain conditions of age and citizenship and to applicants having completed, at least, the full general or teacher training secondary course. Candidates must pass an entrance examination

which varies according to the subjects which they wish to teach. They must also be physically and psychologically suited for teaching. The studies last for three or four years.

Teachers trained at the institute are given priority when appointments are made to a certain number of posts, all of which are filled on a competitive basis, either by examination or on qualifications. Teachers already in service before the institute was created have retained their rank and a certain number of posts are also open, on a competitive basis, to candidates who have not graduated from the institute.

As a state official, a young teacher with an Instituto de Profesores diploma has an established career before him. His weekly classroom hours can be increased up to the maximum limit, with corresponding material and professional advantages, and he can rise to the rank of inspector, senior inspector, headmaster of a *liceo*, etc. His rights and obligations are governed by the Teachers' Statute and the Association of Secondary and Preparatory Teachers sees to it that the privileges of the teaching profession at this level of education are respected.

Vocational and technical schools

As we have seen, state vocational and technical schools are controlled by the Universidad del Trabajo, an autonomous body under the Ministry of Public Education.

The aims of the Universidad del Trabajo are set out in Article 4 of the Law of February 1943: provision of '. . . (a) general education calculated to raise the intellectual level of the workers and the standard of their technical training; (b) full instruction in technical, manual and industrial subjects, special attention being given to fields connected with the industries extracting or processing national raw materials; (c) further education for workers; (d) instruction in the applied arts; (e) aid in improving existing industries, encouragement of, and co-operation with, such new ones as may be introduced; (f) information on the structure and working of the nation's industries; (g) testing of technical aptitudes'.

The minimum age for admission to establishments under the Universidad del Trabajo is 13, but this may be lowered for candidates who are physically suitable and have the necessary educational background; in some specialized schools, particularly residential agricultural schools, the age-limit is 15 years. Candidates for admission must hold the school-leaving certificate showing that they have completed six years of primary schooling.

The following Schools are controlled by the Universidad del Trabajo:

Escuela Industrial de Mecánica y Electrotécnica. The school trains students for all trades and professions connected with mechanical and electrical engineering. Two levels of instruction are provided, the first for new entrants from the primary schools, the second for those who have completed the general secondary school course or the lower technical cycle. There are morning, afternoon and evening classes.

Escuela de Industrias de la Construcción. This school provides training courses for workers in the building industry, technical courses for general secondary school graduates and graduates of the three 3-year courses of the Universidad del Trabajo, and continuation courses for those already at work. The special subjects taught are many and varied and the hours vary accordingly.

Escuela de Artes Gráficas. Provides training in the various printing trades.

Escuela de Artes Aplicadas Decorativas. Courses in applied decorative arts.

Escuela de Industrias Navales. Offers instruction in many important nautical trades and occupations. The course is divided into three consecutive cycles, the first and second lasting 3 years each, and the third, 2 years.

Escuela de Comercio. The first cycle, lasting 2 years, provides a general commercial training; the second, a 1-year course, trains students for secretarial work in business.

Sección Fotocinematográfica. Takes students who have completed the first-year radio course given by the Escuela Industrial de Mecánica y Electrotécnica and trains them as film operators.

Escuela de Industrias Femeninas. Provides day and evening courses of varying length in women's trades.

Escuelas Industriales de la Unión y de El Cerro. These two industrial schools, located in populous districts of Montevideo, provide day and evening courses for both men and women in a variety of fields such as mechanical and electrical trades, modelling, blacksmithing, basket-making, carpentry, cutting and tailoring, etc.

Evening courses in theory. Supplementary technical training for workers.

Teacher training courses. Two-year training courses for industrial school-teachers are provided for graduates, who must be at least 18 years old, of the various schools. Classes are given in teaching methods, mathematics, drawing, language, technology and workshop practice. Candidates for the course must pass an entrance examination.

The institutions listed above are all situated in Montevideo. There are industrial schools in all the provincial capitals and in many of the inland towns and villages. Candidates for admission to these schools must be at least 12 years of age and have completed six years of schooling in an urban primary school or four years in a rural primary school. The courses given are on the same lines as those of the industrial schools in Montevideo. There are also the following specialized agricultural schools:

Escuela de Silvicultura de Maldonado. This residential school provides 2-year courses leading to the diploma of forestry expert. The minimum age of admission is 15 years.

Escuela de Lechería de Colonia Suiza. Provides a 3-year course leading to the diploma of dairy-farming expert and 2-year courses for dairy-workers.

Escuela de Enologia de El Colorado. Offers a 2-year course leading to the certificate of proficiency of trained cellarman, and a 3-year course leading to the diploma of oenologist. The minimum age of admission is 15 years.

Escuela Agropecuaria de Durazno. Provides a 2-year course for farm workers (stock-raising) and a 3-year course for agricultural and stock-farming specialists *(expertos agropecuarios)*. Classes in farm mechanics and the handling of agricultural machinery are other specialities of

this residential school, for which the minimum age of admission is 13 years.

Fourteen agricultural schools in other parts of the country offer 3-year courses leading to the diploma of agricultural specialist. The minimum age of admission to all of them is 13 years.

In addition there are various private industrial and agricultural schools, most of them run by religious educational institutions, which confer their own diplomas. Private industry usually trains its own technicians. In the field of commerce, there are many private business schools which prepare students for administrative work in both state and private organizations.

Teacher training schools

Before the 1955 plan was introduced, pupils who had completed the sixth year of primary schooling went directly to the teacher training institutes, where they were given four years of general education and three years of vocational training. Today they take the first part of this training in the general secondary *liceos*. After four years in the *liceo*, candidates who have obtained an average assessment of 'Good' over the four years can go straight on to the teacher training school; pupils with lower marks must first take an entrance examination.

Students who have completed the 6-year *bachillerato* course can enter the teacher training schools without an entrance examination.

The fact that all schools in Uruguay, both urban and rural, were staffed by qualified teachers made it possible, under the 1955 plan, to extend the teacher training course to four years in addition to the four years of basic general education.

In the provincial capitals and major towns elsewhere in the country there are also various private teacher training institutes whose students can sit for the official examination and obtain the official diploma, after which they enjoy the same rights in competition as graduates of the national teacher training schools. The same opportunities are also open to private students.

Lately there has been a considerable increase in post-graduate, refresher and specialized training courses for instructors at teacher training institutes, teachers in special branches of education, inspectors, etc.

Other specialized schools

Other secondary-level public schools like the National School of Fine Arts, the National School of Music and the municipal schools of dramatic art and music offer practical classes and theoretical courses of general culture. Candidates must pass an entrance examination.

Out-of-class activities

All secondary school students in Uruguay belong to federations and associations which are themselves members of the Federation of Uruguayan University Students, to which the student associations of the various faculties also belong. There is a very active student union life and the opinions of the federation carry great weight in the general life of the country in both the politico-ideological and cultural spheres. Theatrical activities are organized at nearly all *liceos*, and at the university itself there is an experimental theatre which is a centre of dramatic art for all students—from the university, and from secondary, industrial and other schools—who want to participate. Special free performances for students are put on regularly by the official musical and theatrical institutions.

Sports are controlled by the National Commission for Physical Education, which is also responsible for training PE instructors for student gymnastic classes. In both Montevideo and the rest of the country there are many playing fields run by this National Commission, where students can train prior to taking part in various sports and gymnastic contests (university championships and games) between *liceos*, schools, faculties, etc. Basketball, swimming, volleyball, football and athletics attract many participants.

[*Text prepared by the Unesco Secretariat in June 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 2,700,000.
Area: 72,172 square miles; 186,926 square kilometres.
Population density: 37 per square mile; 14 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957, total enrolment in public educational institutions was 337,000; allowing for private school enrolment, the total school-going population may be estimated at 400,000, which is about 15 per cent of the total population. Approximately three-fourths of these pupils were enrolled in primary schools and one-seventh in secondary schools. The proportion of girl pupils was about 50 per cent in the public pre-primary, primary and secondary schools and 56 per cent in the private primary schools. At one of the teacher training schools (Instituto Normal de Montevideo) 97 per cent of the pupils were girls. Between 1953 and 1957, there was an increase of 12 per cent in primary school enrolment, but only a 5 per cent increase in the number of teachers; hence the pupil-teacher ratio in 1957 was 33, as compared with 31 in 1953. In the public *liceos*, there were only 14 pupils per teacher in 1957. (See Table 2.)

Examination results in secondary education, 1953–57. The following data were reported on the number of certificates granted at the completion of teacher training courses: 'First grade' teachers' certificates—(1953) 204, (1954) 214, (1955) 327, (1956) 380, (1957) 162; 'National' teachers' certificates—(1953) 251, (1954) 190, (1955) 270, (1956) 471, (1957) 389.

Almost all the recipients of the first grade teachers' certificates were women (95–99 per cent). No sex distribution is available concerning the national teachers' certificates.

Educational finance, 1958. In the fiscal year beginning in January 1958, educational expenditure amounted to 148,335,916 pesos, averaging 55 pesos per inhabitant. Of this sum, 148,122,052 pesos came from the Central Government, 181,357 pesos from provincial authorities and 32,507 pesos from other sources not specified. The distribution of recurring expenditure by level and type of education is given in Table 1.

Source. Uruguay: Ministerio de Instrucción Pública y Previsión Social, reply to Unesco questionnaire.

VENEZUELA

THE EDUCATIONAL SYSTEM

The Venezuelan educational system is based on explicit constitutional provisions.

The Constitution reserves to the Central Government the power to lay down general educational and cultural principles and standards and to prescribe how educational and cultural institutions, associations and services shall function. (Article 60.)

At the same time it states that—subject to due conformity with national laws and regulations—education is among the services which local authorities have power to organize. (Article 21.)

It goes on to guarantee freedom of education to Venezuelan residents, subject to such limitations as may be prescribed by law. (Article 61.)

The principles contained in these three articles are developed in the Education Act, the first two clauses of which lay down respectively the aims of education and the principle of state supervision in the following terms:

1. The object of public education is the intellectual, moral and physical development of the people. The pursuit of this object must be adapted to the purpose of training citizens who are capable of sharing effectively in the fulfilment of Venezuela's destiny and who are imbued with the principles which inform Venezuelan democracy and with the conscious desire for international co-operation.

2. The State exercises supervision over schools to ensure the fulfilment of the objects it assigns to education and the requirements of the law and regulations.

Private persons may found and maintain schools subject to the limitations prescribed by law. Accordingly the institutions dealt with in the Education Act are classified respectively as public and private, the former being those established and maintained by the national administration, the states, the federal territories, local authorities and autonomous bodies and the latter those established and maintained by private individuals.

To safeguard the cultural heritage of the nation, it is prescribed by law that all instructional activities in schools shall be conducted in Spanish, save for the teaching of foreign languages, and on the understanding that works in languages other than Spanish may be consulted.

The Ministry of Education is required to provide the necessary co-ordination in respect of the teaching in all public schools, the opening and location of schools, the appointment of teachers and all matters affecting the organization of the public education service.

Primary education is compulsory from the age of 7, and free of charge in all public schools.

The structure of the Venezuelan school system is shown in the diagram on page 1445.

THE DEVELOPMENT OF SECONDARY EDUCATION

Venezuela's first Code of Public Education was promulgated in 1843; it specified that the subjects to be taught in the National Colleges (secondary level) should be Latin, Spanish, and philosophy. On completion of certain formalities and with presidential authorization, such colleges could transform themselves into universities.

In 1881 the Division of Public Education (Ministry of Internal Affairs) was raised to the status of an independent Ministry. There followed a succession of sporadic additions and amendments to the Public Education Code of 1843 and to the Decree on Compulsory Primary Education of 1870, which were, however, consolidated in a single legislative instrument with the promulgation of the second Public Education Code in 1897. Early in the present century, approval was given successively to the Codes of 1904, 1905, 1910 and 1912, all of which provided for free compulsory public primary education and for liberty of education, but imposed a progressively heavier measure of centralized state control. During this period, nothing was done about secondary education and there was no sharp line of demarcation between it and primary; in their curricula schools at secondary level followed the pattern of the French classical *lycée*.

In 1914 the Federal Executive promulgated an Organic Decree on National Education which broke with the legislative tradition of state-imposed limitations on the freedom of education, and confirmed that principle unreservedly. Only as regards examinations, which it sought to make more severe, did the decree provide for state supervision.

In 1915 the National Congress legislated anew on education but, far from consolidating everything in a single code, it produced both an Organic Education Act and a series of separate Acts on state certificates and degrees, public primary education, public secondary education, public teacher training schools, higher education, special education, state inspection of education and compulsory education. Secondary education was divided into two cycles, a 4-year general cycle and a 2-year specialist cycle with separate streams for mathematics and mathematical sciences, biological sciences and philosophy and letters.

The above legislation with the corresponding regulations and curricula remained in force until 1924 when the new Education Act cut down secondary education to a single undifferentiated 4-year course.

The political and social changes which took place in Venezuela from 1936 onwards brought with them new educational ideas strongly influenced by pedagogic missions from other Latin American countries. After two abortive attempts to change the outdated legislation on education, a National Education Act was finally passed in 1940. The change in its title alone—*educación* instead of *instrucción*—is an indication of the new attitude prevailing.

GLOSSARY

ciencias: see *liceo.*

curso prevocacional: upper primary classes with practical bias leading to vocational education.

escuela agrícola: vocational training school of agriculture.

escuela artesenal: vocational training school for artisans.

escuela de administración: vocational training school for office workers.

escuela de artes y oficios para mujeres: vocational training school of home economics and women's occupations.

escuela de servicio social: vocational training school for social welfare workers.

escuela militar: vocational training school for one or other of the armed services.

escuela normal: teacher training school.

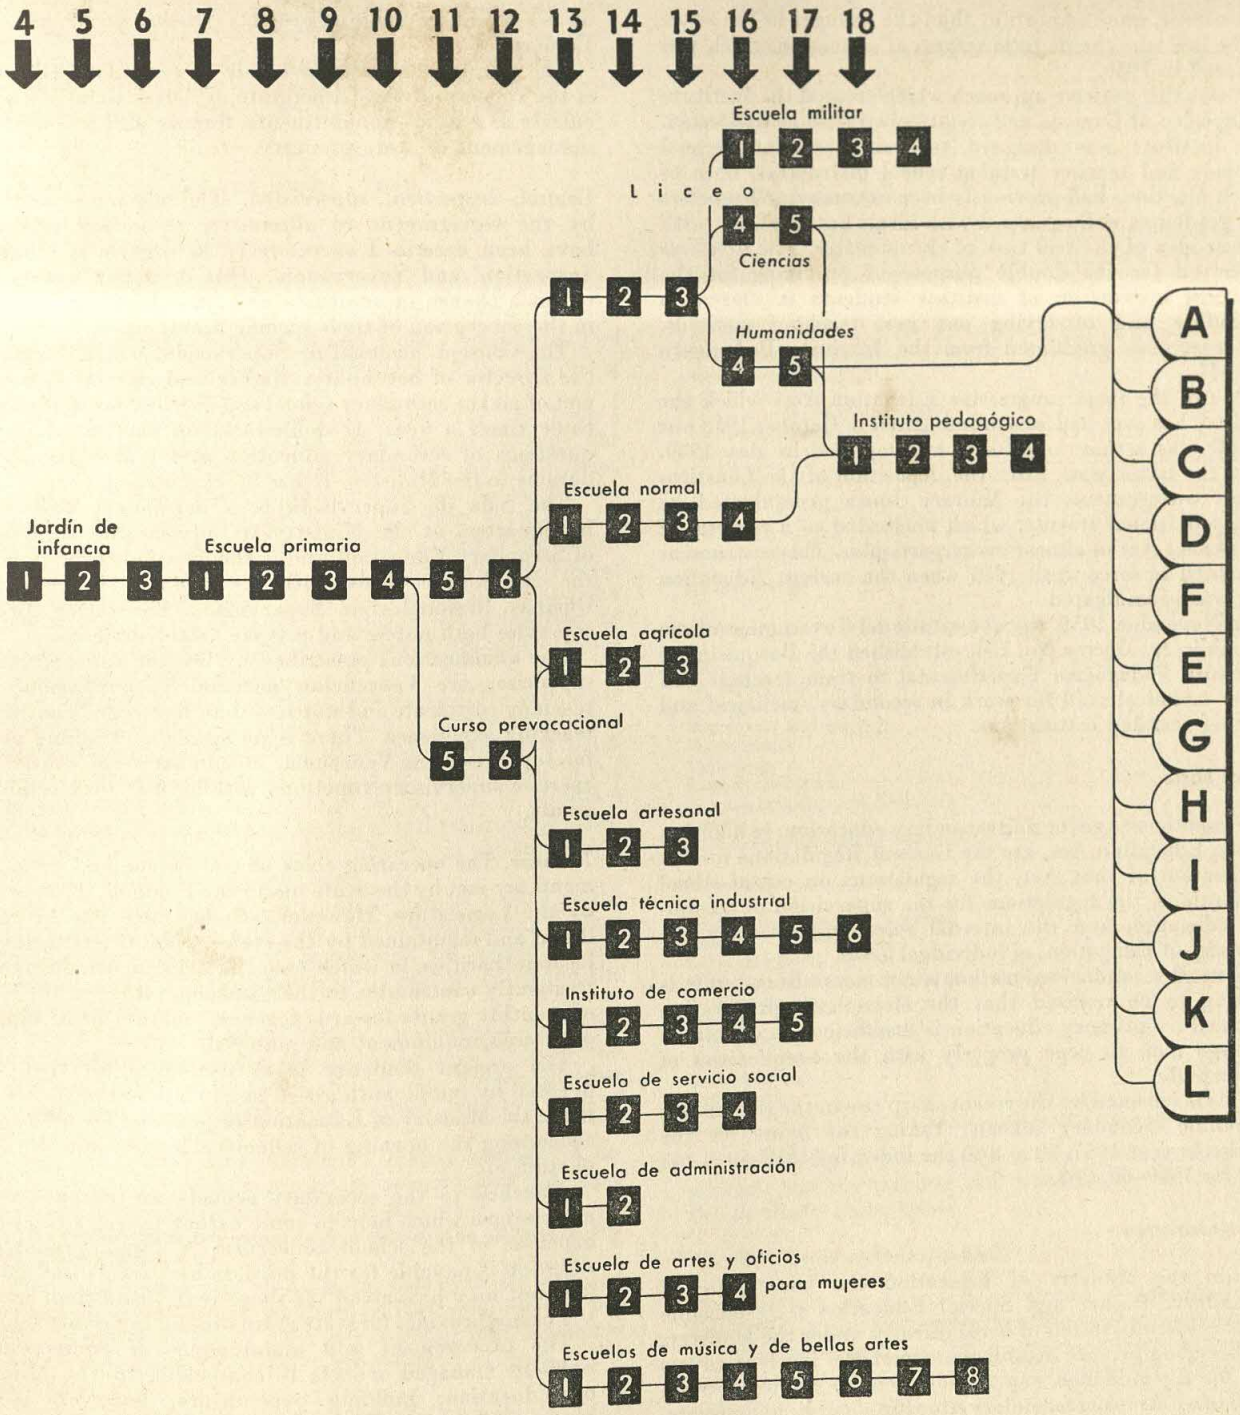
escuela primaria: primary school.

escuelas de música y bellas artes: vocational training schools of music and fine arts.

escuela técnica industrial: vocational training school for mechanics, electricians, plumbers, metal workers, cabinet makers, etc.

humanidades: see *liceo.*

instituto de comercio: vocational secondary school of commerce.



instituto pedagógico: teacher training college for teachers in secondary and teacher training schools.

jardín de infancia: kindergarten.

liceo: general secondary school with lower cycle of core subjects and upper cycle emphasizing either literature and language (*humanidades*) or science (*ciencias*).

However, more important than the changes in the letter of the law was the *de facto* reform of education which was initiated in 1936.

It was this positive approach which created the Instituto Pedagógico of Caracas and its attached *liceo de aplicación*. The institute was designed to train secondary school teachers and teacher training school instructors, both of which functions had previously been entrusted to bachelors and graduates well equipped with ideals but less often with a clear idea of the real task of the educator. The *liceo* was conceived for the double purpose of providing for the practical instruction of institute students in classroom procedure and of trying out new teaching methods. The first class graduated from the Instituto Pedagógico in 1941.

One of the most progressive Education Acts which the country has ever had was promulgated in October 1948 but its life was a short one for it was repealed in May 1949.

In the latter year, after the deposition of the Constitutional Government, the Military Junta promulgated its own provisional statute, which amounted to a reversal of the former Act in almost every particular. This instrument remained in force until 1955 when the current Education Act was promulgated.

In November 1959, the Constitutional Government of the Republic, by Decree No. 164, established the Barquisimeto Instituto Pedagógico Experimental to train teachers and other technical staff for work in secondary, technical and teacher training institutions.

Legal basis

The enactments governing secondary education, in addition to the Education Act, are the General Regulations for the application of that Act, the regulations on out-of-school institutions, the regulations for the supervision of secondary education and the internal rules, approved by the Ministry of Education, of individual *liceos*.

General secondary education is not compulsory but it is coming to be realized that the elementary preparation afforded by primary education is insufficient to enable an average man to cope properly with the complexities of modern life.

This is reflected by the recent sharp rise in the enrolments in public secondary schools. Taking the figure for the academic year 1957–58 as 100 the index for 1958–59 is 147 and for 1959–60, 202.

Administration

Within the Ministry of Education the Directorate of Secondary, Higher and Special Education is responsible for the administration of *liceos* directly under the Ministry, for licensing private establishments at the levels it covers and for the guidance, supervision, control and registration of all institutions of secondary education, public and private, in the country.

The Ministry's Technical Directorate deals with enrolment records, educational tests, examinations for promotion, curricula and syllabuses and school textbooks (Consejo Técnico de Educación), the collection of statistical data (Sección de Estadística) and the provision of technical advice on school building projects (Oficina de Arquitectura Escolar).

The purely administrative side of secondary education is the concern of the Directorate of Administration, particularly as regards appointments, finance and accountancy, management of state property, etc.

Control, inspection, supervision. The agencies employed by the Government to administer secondary education have been described successively as organs of 'control', 'inspection' and 'supervision'. This does not simply represent a change in nomenclature but reflects an evolution in the conception of their specific functions.

The Consejo Nacional de Supervisión, which consists of the Director of Secondary, Higher and Special Education and of all the secondary school supervisors, normally meets three times a year. It deliberates on the broad general questions of secondary education and makes recommendations to the Ministry. It has no executive powers.

The Sala de Supervisión is a permanent body with headquarters at the Ministry. It advises the Directorate of Secondary Education and is the channel through which the Directorate deals with its regional bureaux, the Oficinas Regionales de Supervisión. The latter directly supervise both public and private establishments.

The qualifications prescribed by law for appointment as supervisor are Venezuelan nationality, possession of a teaching certificate and not less than five years' continuous teaching experience. There is no specialist training course for supervisors in Venezuela. Headmasters of course also exercise supervisory functions within their own establishments.

Finance. The operating costs of state secondary establishments are met by the State under the Finance Act approved by the Legislature. However, schools may also be established and maintained by the states, federal territories and local authorities, in which case the Central Administration frequently contributes to their upkeep, either in the shape of monthly grants towards teachers' salaries or of supplies of teaching equipment and material.

The present tendency is to centralize all the funds devoted by public authorities to educational purposes and make the Ministry of Education responsible for all matters concerning the opening of schools, selection and payment of staff, etc.

Attached to the secondary schools are parent-teacher associations which help to some extent to cover the minor expenses of the school concerned. A small annual subscription is payable for the purpose by parents and guardians but may be waived for those with insufficient means.

The law provides for state grants-in-aid to private schools.

The procurement and maintenance of equipment in publicly managed schools is chargeable to the Ministry of Education; building expenditure, however, is the responsibility of the Ministry of Public Works whose annual budget includes appropriations voted for this purpose.

School welfare services. The principal *liceos* have their own free medical and dental services, with doctors, dentists, nurses, social workers and auxiliary personnel paid by the State. In addition schools which need them have

subsidized meal services (lunches), with equipment and staff also supplied free by the Ministry of Education. These services, which are under the supervision of the Patronato Nacional de Comedores Escolares, provide pupils with balanced meals at prices much below their real cost.

TYPES OF SECONDARY EDUCATION

General secondary schools

In the law as it now stands, the objects of general secondary education are 'to continue the formative process begun at the primary level, provide pupils with a background of general culture and prepare them for entry into other branches of education'.

The course is divided into two cycles: the first lasts 3 years, and the second, which takes pupils through the initial stages of specialization in science or the humanities, 2 years. On completion of their studies pupils sit for the *bachillerato* examination, success in which is the basic qualification for entrance to institutions of higher education.

Some schools provide both daytime and evening classes; the first are held between 7 a.m. and 6 p.m., and the second from 6 p.m. to 11.30 p.m. Applicants for admission to evening classes must be over 16 years of age and produce a certificate of employment.

Persons over 25 years of age in possession of the certificate of general secondary education can enter for the *bachillerato* examination in the branch of their choice without attendance at a school, subject to offering all the subjects in the relevant curriculum. The *bachillerato* can also be obtained by students at military and ecclesiastical institutions when the syllabus comprises the same subjects, at the same level as the official secondary syllabus.

The academic year for all public schools begins on 16 September and ends with the July examination. August and the first fortnight of September are holidays. The National Executive is empowered by statute to amend the dates indicated.

Classes can be held on all days of the academic year with the exception of Sundays, the period from 20 December to 6 January inclusive, Good Friday to Easter Sunday inclusive, Carnival Monday and Tuesday, and the days of the National Holiday.

Not more than four successive hourly periods of instruction are allowed in secondary schools, and not more than one hour's instruction without a break.

The curriculum for secondary education is shown in the following table.

First and second year pupils in the first cycle are required to do two hours' practical work in biological science per week, while two hours each per fortnight in biological science, physics and chemistry are required of them in the third year.

Second cycle pupils on the scientific side are required to do two hours' practical work per fortnight per subject in physics, chemistry and biology, and those in their final year do two hours practical mineralogy and geology per month.

The practical work is done in groups which may not number more than 20 pupils.

Teachers for the various types of secondary education—general, teacher training and vocational—are trained at the Instituto Pedagógico.

Vocational and technical schools

The División de Educación Especial of the Ministry of Education is responsible for the development and efficiency of technical education. This comprises trade schools, the industrial training schools, the Experimental Institute of Industrial Education, the schools of arts and crafts, the social service schools, the schools of nursing, and the commerce institutes. Schools of agriculture come under the Ministry of Agriculture.

Pre-vocational education. In a certain number of primary schools attached to trade schools there may be

pre-vocational training courses available in the fifth and sixth years.

Trade schools. These schools accept pupils who have secured the primary school certificate or successfully completed the sixth year of primary education. The instruction provided (three years) enables pupils to learn the trade of their choice. On completion of the second year in the trade school, pupils may, if they wish, enter industrial technical schools as third year pupils.

Industrial technical schools. These schools accept pupils who have completed primary school, and provide training to tradesman level in fields such as mechanical engineering, electricity, etc.

Experimental Institute of Industrial Education. To qualify for admission to this institute, applicants must have completed at least the first cycle of training in an industrial technical school, or have at least two years' experience as workshop supervisors in a trade school, or have not less than five years' experience in industrial employment after completion of primary school. The main purpose of the institute is to provide 1-year qualifying courses for instructors' appointments in the industrial and trade schools. It also has a school for practice teaching (Escuela Industrial de Aplicación) with a 4-year course leading to the *certificado de operario especializado* (skilled operative's certificate).

Schools of arts and crafts. The most important of these is the Caracas Escuela Superior de Artes y Oficios, a school for girls. Its objects are similar to those of the trade schools, but the curriculum covers four years.

Social service schools. These schools provide a 4-year course to train social workers.

Schools of nursing. The course of study at the *escuelas normales de enfermeras*, which provide full training for the nursing profession, consists of three years of three terms each.

Commercial institutes. These schools train staff for the various types of office work in business and also prepare pupils for advanced commercial studies. They are classed as E, D, C, B and A according to the level and type of course they provide. Type E provides a secretarial course and a book-keeping course, each of three years' duration and each providing 15 hours of instruction per week and per year. The former prepares pupils for the *certificado de oficinista* (general clerk) after two years' study and the *certificado de corresponsal* (correspondence clerk) after three years; the latter prepares for the *certificado de auxiliar de contabilidad* (ledger clerk) in two years and the *certificado de contabilista* (book-keeper) in three years. Types D to A form a 5-year sequence of studies, certificates being awarded at the end of each stage, as follows: Type D—*Certificado de auxiliar de secretaría* (secretarial assistant); Type C—*Certificado de secretario* (secretary); Type B—*Certificado de perito mercantil* (mercantile assistant); Type A—*Certificado de técnico mercantil* (mercantile executive). The following table shows the subject requirements for the various types of certificate.

Teacher training schools

Teacher training is primarily the responsibility of the State, in order that it may ensure the inculcation of its democratic principles. At present it is given in the teacher training schools (*escuelas normales*) and at the Instituto de Mejoramiento Profesional del Magisterio, which provides additional training for certificated teachers and prepares the uncertificated for the professional examinations. According to the source of their funds, teacher training institutions are classified as public—maintained by the Ministry of Education, the states, local authorities, etc.—or private. Public teacher training schools are further classified into (a) conventional teacher training schools (4-year course) and (b) experimental teacher training schools. At present there are four of the latter in Venezuela.

Special mention should be made of the Instituto Experimental de Formación Docente established by Ministry of Education Order No. 5813 dated 14 September 1959, which is intended to conduct experiments in the methodology both of classroom teaching and of the specialized techniques now used as aids to the achievement of optimum teaching results.

The specific function of the institute is to provide a 2-year training course, in addition to the basic secondary cycle of three years, with the following objectives: (a) provision of teachers with an acceptable level of academic knowledge for the Public Education Service; (b) equipment of teachers with sufficient scientific training to apply modern apprenticeship techniques and conduct research on educational problems; (c) awakening in prospective teachers of the essential enthusiasm for their profession and devotion to the cause of public education with a high sense of the social responsibilities of their office; (d) training of student teachers in such a way as to enable them, once they are teachers, to serve the communities in which they work in the social sphere, and contribute to the improvement of the living conditions of their fellow citizens.

For admission to teacher training establishments the requirements, in addition to the Primary School Certificate (6th grade), are good health, absence of physical defects liable to affect professional efficiency, and proof of good character.

During teacher training, tests in each subject are held at intervals over the academic year, and students' progress is assessed on the basis of the work done up to the date of the annual examinations which take place in July. Markings are in round figures ranging from 1 to 20.

The Education Act provides for the holding of 'repeat' examinations in the first fortnight of September immediately before the start of the academic year, for those who fail in the ordinary July examinations. Deferred examinations are held at the same date for those who were unable, for proven and acceptable reasons, to sit for the ordinary examinations.

Students having obtained less than 10 marks in not more than two subjects in the deferred or 'repeat' examination are allowed to go on to the next class in the normal way but their eligibility for examination with that class is conditional on proof that they have reached the pass standard in the failed subjects.

The teaching staff required for the teacher training schools is trained at the two *institutos pedagógicos*, one at Caracas and the other, an experimental establishment of recent foundation, at Barquisimeto. The courses of study are specialized and last 4 years. Graduates of university faculties of education are entitled to teach their own special subjects in teacher training schools.

PROBLEMS AND TRENDS

In the first place, it must be admitted that secondary education falls seriously short of requirements as regards quality although, as a result of the efforts begun in 1958, the quantitative situation is satisfactory for the time being. An outstanding problem is the inadequate training received by pupils as regards both knowledge and character building. The reasons for this are many and varied, and include: absence of a national educational policy; arbitrary plan of studies; syllabuses unrelated to the life and needs of the nation; irregular compliance with school time-tables; inadequate training and supervision of teachers; lack of suitable premises; almost complete lack of satisfactory school textbooks; pupils' time taken up with numerous extra-scholastic activities; the negative values finding acceptance in the social sphere; pernicious use of mass media (radio, films, television, the press, posters, etc.); lack of home guidance on problems of adolescence, thus hindering effective co-operation with the schools, etc.

Another problem facing general secondary schools as now organized is the excessive size of the intake, which has grown out of all proportion to that of other forms of secondary education. This, however, is not an inherent problem of general secondary schooling as such, but is due to the advice given to sixth grade pupils leaving primary school and to the fact that little attention is traditionally paid in Venezuela to opportunities for careers other than those which call for university training. Now that public opinion is again coming alive, an unmistakable feeling is perceptible amongst educators as well as in economic, political and professional circles, that a radical change in Venezuela's whole educational structure is imperative, particularly as regards post-primary studies, with a view to developing a genuine and diversified secondary educational system covering both humanistic and vocational studies, with a sound background of primary schooling.

Such a structure would involve two cycles, the first for general education common to all branches but paying special attention to vocational guidance, and the second covering a range of specialized vocational courses and preparatory courses for higher education.

[Text prepared by the Ministry of Education, Caracas, in May 1960.]

STATISTICS

Population (mid-year 1958 estimate):[1] 6,320,000.
Area: 352,143 square miles; 912,050 square kilometres.
Population density: 18 per square mile; 7 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 total enrolment (not including adult education courses) came to nearly 846,000, which was about 14 per cent of the total population. The proportion of girls was approximately 50 per cent in nursery and primary schools, 55 per cent in vocational schools, and 86 per cent in teacher training schools; however, girls represent only one-third of the enrolment in general secondary schools, and one-fourth in the universities. The proportion of women on the teaching staff was 79 per cent in primary schools, 32 per cent in secondary and vocational schools, and 41 per cent in teacher training schools. Average pupil-teacher ratio was 36 in primary schools, 17 in secondary schools, 16 in vocational schools, and 10 in the teacher training schools. Between 1953 and 1957 enrolment increased by 26 per cent in primary schools, 71 per cent in general secondary schools, 40 per cent in vocational schools, 11 per cent in secondary teacher training schools, and 42 per cent in higher education. (See Table 2.)

Enrolment trends in secondary education, 1937–57. Enrolment in secondary schools increased rapidly between 1937 and 1957, particularly in general education. Taking all types of secondary education, the average total enrolment almost doubled every five years. Nevertheless, the average enrolment for the period 1955–57 was still only 13 per cent of the population 15–19 years old. (See Table 1.)

Examination results in secondary education, 1953. The only data available relate to the number of certificates granted in 1953, as follows: *bachillerato*, 1,850 (499 girls); diploma of nursing schools, 227 (all girls); diploma of school of social services, 48 (all girls); diploma of teacher training schools, 620 (506 girls).

Educational finance, 1959. According to data published by the Unesco Regional Office for the Western Hemisphere in the *Buletín Trimestral de Proyecto Principal de Educación Unesco-America Latina*, Vol. 2, No. 5 (January-March 1960), the budget estimate of the Ministry of Education for 1959 amounted to 367,682,000 bolivares, an average expenditure of 56 bolivares per inhabitant. Of the total amount, 165,740,000 bolivares (about 45 per cent) was allotted to primary education. Official exchange rate: 1 bolivar = 0.30 U.S. dollar (approx.).

4. Not including data on agricultural, nursing, social welfare schools, school for telegraph and telephone operators, training school for demonstrators in rural domestic science centres.

REPUBLIC OF VIET-NAM

THE EDUCATIONAL SYSTEM

On achieving independence, Viet-Nam had first to adapt its former educational system to the changed circumstances, then replace it by one more in harmony with the aspirations of its national genius and the exigencies of modern times, and finally, improve on this so as to provide a humanistic and nationally centred education open to all cultural influences.

The principal legislative measures governing the educational system as a whole are as follows:

Decree of 29 December 1949 laying down the organization of national education.

The two Decrees of 20 January 1952, one establishing compulsory primary education for children of both sexes between 6 and 14, the other prescribing the organization of a campaign for the elimination of illiteracy.

Order of 5 September 1949, amended by an Order of 6 October 1950, laying down curricula and time-tables for Viet-Namese secondary education.

Order of 23 May 1951 dealing with the organization of the Department of National Education.

Order of 14 October 1953 reorganizing Viet-Namese secondary education.

Presidential Ordinance of 24 December 1955 incorporating the regional education budgets in the national budget.

The Orders of 25 and 29 June 1956 modifying the 1953 curriculum for secondary education—the former fixing the curriculum and weekly time-table for the teaching of English, the latter laying down the curriculum for the teaching of Chinese characters, Viet-Namese and French.

The Decrees of 12 April and 27 June 1957 modifying the secondary school curricula for history and geography.

Decree of 6 June 1958 reorganizing the Department of National Education by transferring some of the responsibilities of the Regional Director of Education for South Viet-Nam to the Director-General of Primary, Secondary and Popular Education.

Order of 3 February 1955 instituting a Directorate of Technical Education and Fine Arts.

Order of 12 August 1958 laying down the curriculum for secondary education to be applied in the 1958/59 school year.

In the course of the 1958/59 school year educational reforms were carried out in respect of three basic points: organization of the Department of National Education; establishment of the basic principles of education; and drafting and promulgation of the new secondary education curriculum.

The structure of the Viet-Namese school system is shown in the diagram on page 1453.

GLOSSARY

centre d'apprentissage: vocational training centre for apprentices.

classes d'enseignement primaire technique: technical course in upper primary school classes.

collèges et lycées: general secondary schools.

collèges et lycées techniques: vocational (technical) secondary schools.

école d'agriculture: vocational training school of agriculture.

école d'arts appliqués: vocational secondary school of applied arts including graphic arts, ceramics, etc.

école de commerce: vocational training school of commerce.

école de métier (craft school): vocational training school at upper primary level.

école élémentaire de village: village elementary (i.e. lower primary) school.

école normale: teacher training school.

école primaire: primary school.

HIGHER EDUCATION

A. Faculty of Arts.
B. Faculty of Law.
C. Faculty of Medicine and Pharmacy.
D. Faculty of Education.
E. College of Architecture
F. National School of Administration.
G. College of Fine Arts.
H. College of Electrical Engineering.
I. School of Engineering.
J. Military School.

EXAMINATIONS

baccalauréat, 1ère et 2e parties: 1st and 2nd parts of the general secondary leaving examination, qualifying for university entrance.

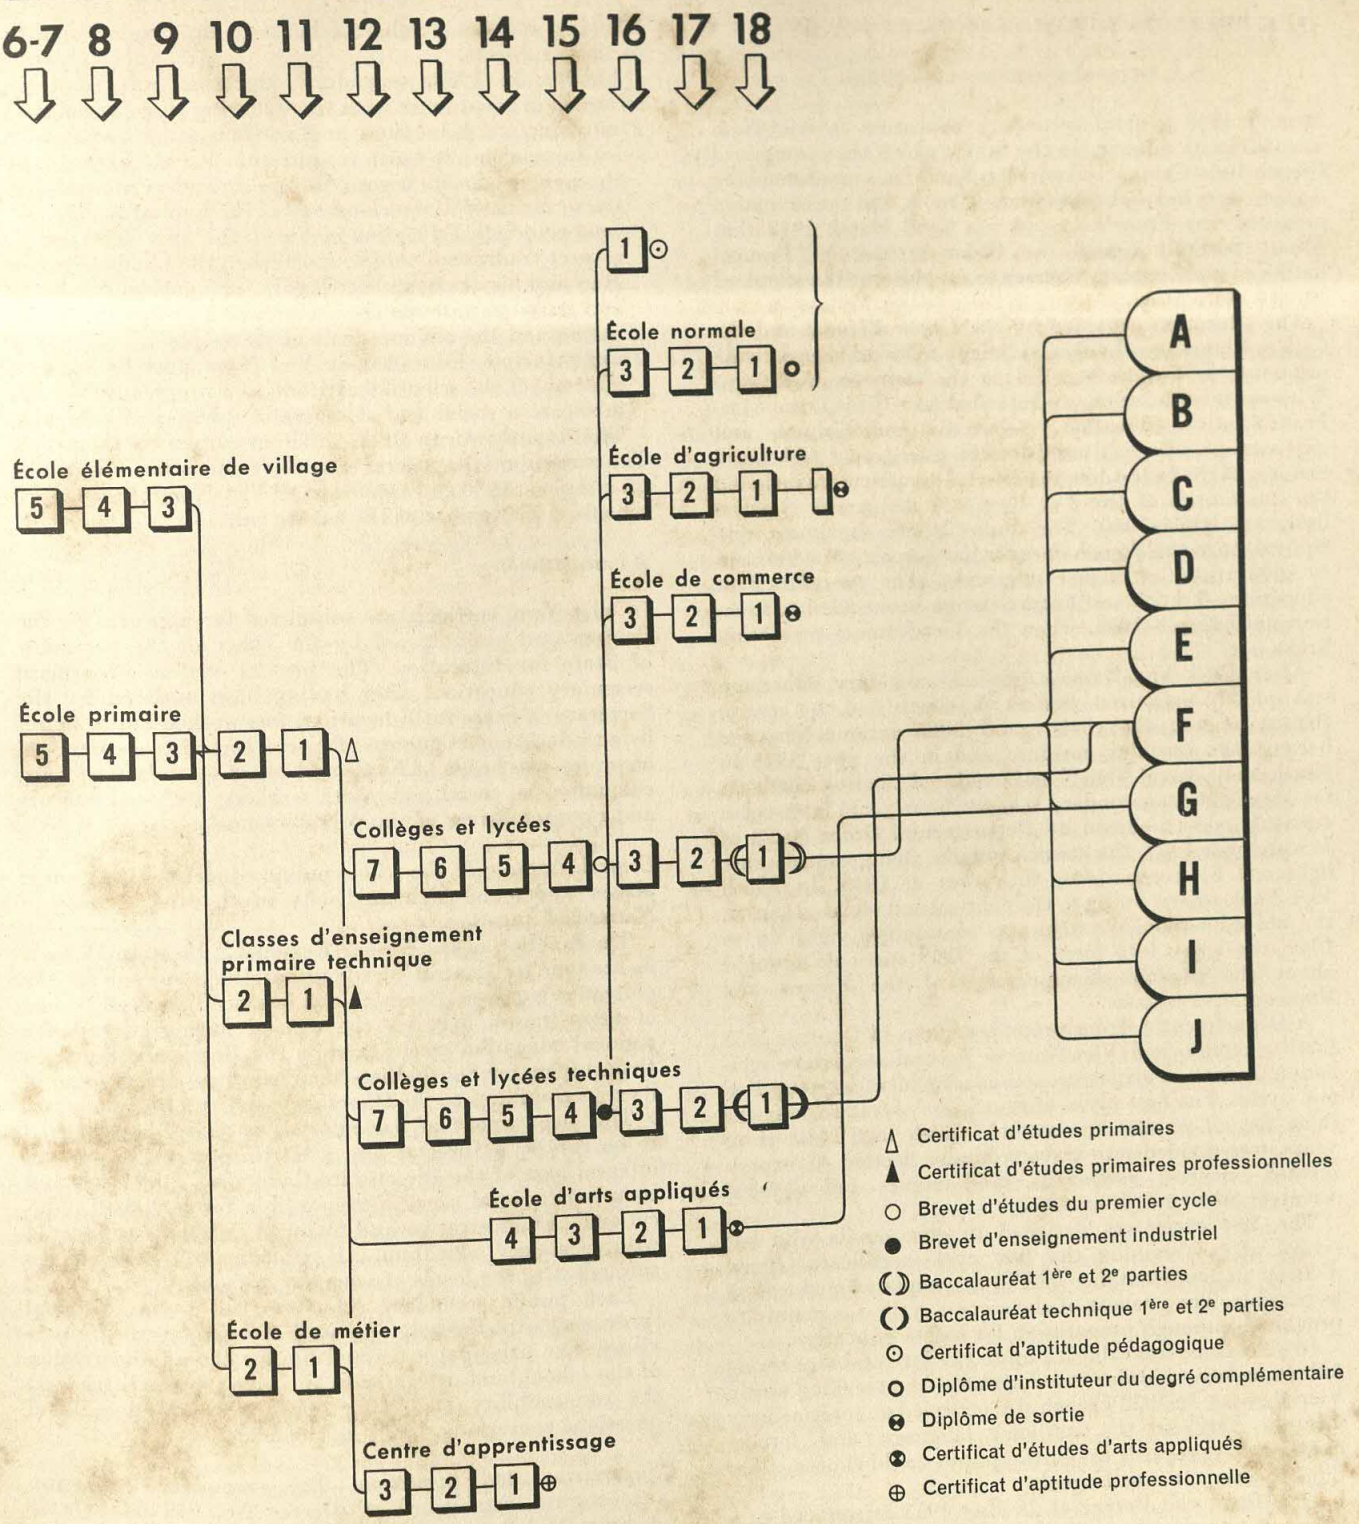
baccalauréat technique, 1ère et 2e parties: 1st and 2nd parts of the technical secondary leaving examination, qualifying for higher technical and technological education.

brevet d'études du premier cycle: lower general secondary certificate.

brevet d'enseignement industriel: lower technical secondary certificate.

certificat d'aptitude pédagogique: teacher training certificate, qualifying to teach in lower primary classes.

certificat d'aptitude professionnelle: vocational training certificate.



certificat d'études d'arts appliqués: certificate of training in applied arts.

certificat d'études primaires: general primary school certificate.

certificat d'études primaires professionnelles: vocational primary school certificate.

diplôme de sortie: leaving diploma.

diplôme d'instituteur du degré complémentaire: teachers' diploma, qualifying to teach in upper primary classes and, provisionally, in the first two secondary classes.

THE DEVELOPMENT OF SECONDARY EDUCATION

I. General secondary education

Around 1900 general secondary education in Viet-Nam was still in its infancy. In the States which then comprised French Indo-China—today, Viet-Nam, Laos and Cambodia —there were but eight secondary schools, and the education provided was French. It was not until March 1918 that Albert Sarrault signed the Order instituting 'Franco-native' complementary courses to supplement the standard French curriculum.

The education provided by the Lycée d'Hanoï and the Collège Chasseloup-Laubat at Saigon followed the curricula obtaining in France and led to the same examinations. Whereas this education was intended mainly for Europeans, Franco-native education, essentially Indo-Chinese and autonomous, was instituted for the intellectual and moral training of the Indo-Chinese masses. Its curriculum included the humanities of the Far East and Annamese classical literature (Quôc-Van). The Indo-Chinese diplomas were equivalent to the French ones for the purposes of admission to institutions of higher education. The two forms of education—French and Franco-native—continued to function until March 1945, when the Viet-Namese revolution broke out.

After 1945 Viet-Namese general secondary education was quickly organized, first in the north and the centre, then throughout the whole country. The national language became the teaching medium and in the year 1945/46 North and Central Viet-Nam introduced the first curricula for Viet-Namese secondary schools. Four years later these curricula were modified by Departmental Order No. 9 of 5 September 1949, the science syllabus being considerably lightened by comparision with that of 1945. In South Viet-Nam, where, owing to the political and social situation, the old educational system was maintained right up to 1949, the entry into force of the 1949 curricula brought about the gradual disappearance of the French and Franco-native courses.

A Departmental Order promulgated on 14 October 1953 further reorganized Viet-Namese general secondary education. In its new structure, secondary education comprised two cycles. The first cycle, of four years' duration, was the same for all pupils; the second, which lasted for three years, was divided into three sections: Section A, experimental sciences; section B, mathematics and physical sciences; Section C, literature.

The first cycle was designed to give pupils who left school after obtaining the first cycle certificate (*Brevet d'études du premier cycle*—BEPC) as complete an education as possible. The purpose of the second cycle was mainly to provide a thorough preparation for higher education.

In all classes, from the 7th up to the 1st—the numbering follows an inverse order (see diagram)—the teaching was in Viet-Namese. In 1958 French still occupied an intermediary position between the national language and foreign languages. As regards the latter, pupils could choose either Chinese characters or English.

The Ministerial Decree of 26 May 1955 introduced profound changes in the syllabus and time-table for ethical instruction and civics, as regards both the nature of the teaching and the number of hours to be devoted weekly to these subjects.

Finally, in 1958, secondary education was basically reformed in accordance with the following three principles:

First principle. Education in Viet-Nam must be inspired by humanism; it must respect the sacred character of the human person, regard Man as an end in himself and strive for the full development of the human being.

Second principle. Education in Viet-Nam must be national, respect traditional values, strengthen the bonds between Man and his environment (family, occupation, country), and strive to promote the security and prosperity of the nation and the advancement of its people.

Third principle. Education in Viet-Nam must be open to all, respect the scientific attitude as a progressive factor, inculcate a social and democratic spirit, and recognize what is authentic in all the different cultures of the world.

The curriculum for general secondary education was drawn up in August 1958 and applied in all Viet-Namese secondary schools in September of the same year.

Administration

In Viet-Nam, curricula are submitted for approval to the Cabinet and promulgated by the Office of the Secretary of State for Education. The present system of general secondary education, after having been outlined by the Secretary of State for Education, was worked out in detail by an Educational Congress of special committees composed of professors, heads of *lycées* and other secondary schools, educationists, social and youth workers, etc., and parents and representatives of the private schools.

Control. At present the whole public educational system is placed under the high authority of the Department of National Education.

The function of the former Regional Education Departments (one for Central Viet-Nam, at Hué, and one for the plateau regions, at Banméthuôt) has been reduced to one of mere liaison between the central authority and the regional education services, while the Regional Education Department for South Viet-Nam has transferred some of its responsibilities to the Directorate-General of Education.

The Department of Secondary Education, which used to be run by a Director and a few inspectors, is now an integral part of the Directorate-General of Education and comprises several services responsible for technical, educational, administrative and financial questions connected with secondary education. All departmental decisions go through it to the heads of secondary schools.

Each public secondary school is run by a principal (*proviseur*) with the help of a staff of assistants and supervisors. The principal is responsible for the administration of the school, and delegates to the vice-principal (*censeur*) the responsibility of settling technical and educational questions concerning pupils and teachers.

Supervision and inspection. The secondary education inspectorate, established by Decree No. 945 GD/ND of 6 June 1958, has its headquarters at Saigon, and comes under the control of the Director of Secondary Education and the Director-General of Education. Its authority

extends over all secondary institutions, public, private, foreign or semi-official.

The task of the inspectorate is not only to supervise secondary schools, but also to assist the Director of Secondary Education in dealing with technical and pedagogic problems. Inspectors must give inexperienced teachers detailed advice with a view to improving their teaching methods and increasing their efficiency. They are also responsible for organizing lectures and teacher training courses during the long vacation.

The chief inspectors must see that all teachers in public secondary schools are inspected at least once a year. In collaboration with the inspectors, the heads of schools, assisted by the education boards and class boards, maintain constant supervision over the educational activities of the teachers under their authority.

Chief inspectors of secondary schools are appointed by an order of the Secretary of State for Education, and are selected from amongst former principals of schools, secondary school teachers and university lecturers, with due regard to their cultural background, educational competence and moral standing.

Finance. Secondary schools are of three types: national public institutions; private institutions; and semi-official institutions.

Education in national public secondary schools is free. The National Assembly of Viet-Nam each year adopts the national education estimates which are prepared and submitted to it by the Department of National Education.

Before the 1955 reforms, the expenditure of provincial *lycées* and *collèges* was financed not out of the national budget but out of the budgets of the regional administrations. These secondary institutions consequently came under the authority of the regional Governor for financial and administrative purposes. After the Geneva Agreement, a Presidential Ordinance, issued on 24 December 1955, established a single national budget for all regions of the Republic of Viet-Nam. Similarly, the teaching body of the whole country comes under the sole authority of the official in charge of the Department of National Education.

For the school year 1957/58 budgetary credits allocated to the Department of Education were in the region of 600 million piastres. Supplementary amounts were derived from the contributions of the various municipal, provincial and local budgets, and also from foreign aid. The secondary education estimates represent about 22 per cent of the total education budget—a percentage more or less equal to the sum total of the various scholarships, grants and allowances awarded to pupils and students at the various educational levels.

The national education budget approved by the National Assembly for the school year 1958/59 amounted to 788 million piastres. Of this total, 190 million piastres, or 24 per cent, were intended for the maintenance and upkeep of *lycées* and *collèges*. This increase in budgetary allocations over the year 1957/58 reflects the Government's strong desire to carry on its efforts to build an educational system in keeping with the legitimate aspirations of youth and the exigencies of modern society.

Private secondary schools, which are rather costly for the parents, at present number 286 with an enrolment of 59,322 pupils. Fees range between 1,000 and 2,000 piastres a year for pupils in the first cycle of the secondary school, and rise to about 4,500 piastres in the second cycle.

Semi-official schools are subsidized by the State, so fees are lower. Semi-official schools are run on different lines from public or private schools: they are placed under the control of a Board of Administration, presided over by a representative of the Viet-Namese Government, generally the provincial Governor or the mayor of the locality. Over 12,000 pupils attend semi-official secondary schools. For the year 1957/58 the Department of Education spent three million piastres on subsidies to the 38 semi-official schools.

Buildings and equipment. The Department has set certain standards concerning space and equipment in classrooms.

In the school year 1948/49 Viet-Namese public secondary education had at its disposal 12 school buildings for 5,270 pupils over the whole territory controlled by the National Government. By the year 1953/54 these figures had risen to 33 and 21,710 respectively.

After the Geneva Agreement, at the beginning of the school year 1954/55, the National Government transferred five of the biggest public secondary schools from North Viet-Nam to Saigon. Some 6,000 pupils and 160 teachers then took refuge in the South; consequently schools had to be equipped and new buildings erected. By 1957, some 31 public *lycées* with a total of 115 classes had been installed in the new buildings.

During the school year 1957/58 six new public *collèges* with a total of 21 first cycle secondary classes were built—bringing the number of school buildings for public secondary education to 61. With regard to equipment, the new buildings are well furnished but lacking in scientific laboratories, a deficiency which the Department of Education has been endeavouring to make good.

II. Vocational and technical education

The development of vocational technical education may be divided into three stages.

The first stage (from 1920 to 1939) was that of the setting up and organization of technical training in application of a Decree of 2 March 1920 establishing the office of Director-General of Education in Indo-China.

The second stage began in 1939. At that time liaison was made between technical training and industry as a result of the appointment of the Head of the Industry and Armament Service as technical adviser to the Director-General of Education in Indo-China. In 1940 technical training was encouraged by the formation of a standing committee on industrial training, which included employers. Accelerated apprenticeship courses began to develop at the same time and many special sections were set up, especially in Tonkin (North Viet-Nam).

In 1941 a classification of the technical education laws was promulgated with the result that curricula began to be standardized. In 1944 a technical education inspectorate was organized, its statute being confirmed by an Order of 26 January 1946. During the second world war relations between Viet-Nam and France were interrupted, and Viet-Nam was forced to manufacture locally some of the manufactured goods it needed. This situation proved favourable

to the development of technical training. In 1945 Viet-Nam, Laos and Cambodia between them had 77 technical schools, training centres and applied arts courses, which offered training to some 3,800 pupils (as compared with 2,000 in 1939).

The third stage opened with the independence of Viet-Nam. The Government then undertook a complete revision of technical training, which involved: re-opening existing institutions; informing the public as to the necessity of promoting technical training; equipping new workshops; drafting a new training programme for workmen in keeping with the industrial needs of the country; encouraging young people to enter the careers opened up by technical training; recruiting new teachers and drafting a new staff statute so that teachers' conditions would not compare too unfavourably with those of technicians in private industry.

With all this in mind, the Government detached technical training from the Directorate-General of Education and, in 1955, set up a Directorate of Technical Education and Fine Arts under the direct control of the Department of National Education.

Administration

The old organization with its national, regional and provincial levels has been maintained up to the present day. At national level the Directorate of Technical Education and Fine Arts, devised as a nucleus from which ramifications will be put forth as resources in staff and teachers permit, has the task of organizing and administering all institutions providing technical training or training in the arts.

This Directorate has two divisions. The first deals mainly with principles, curricula, time-tables, and with the establishing and equipping of technical schools and art schools, while the second division organizes competitive entrance examinations, promotion and leaving examinations for technical schools and art schools, and maintains liaison with regional bodies. The Director of Technical Education is assisted by a chief inspector for vocational and technical schools and one for art schools.

At regional level, technical education is placed under the authority of the Regional Director of Education for administrative and financial purposes, and under that of the Director of Technical Education for technical purposes. The establishment, organization and efficient running of vocational schools in the region are matters for joint consultation between the two authorities.

In each province technical education is the responsibility of the Inspector of Primary Schools, who supervises workshop schools and makes, when appropriate, any suggestions he considers likely to further the cause of technical education. Thus, at the bottom rung of the new technical education hierarchy there are workshop schools, still coming under the primary education administration. The apprenticeship centres are just a step above, then come the *lycées* and *collèges* at the secondary level.

Management and further training boards, composed of industrialists, business men and civil servants, have been set up in technical and art schools to establish liaison and maintain close co-ordination between, on the one hand, the vocational training provided by the Government and, on the other, the requirements of employers (in skilled workmen, technicians and professional staff) and the necessity of developing industry and the handicrafts.

These boards are assisted in their task by the association of former pupils of the technical schools.

The national commissions for vocational training, which are consultative bodies, also advise the technical education authorities on all problems connected with vocational training and manpower requirements.

Organization. Technical and art schools coming under Viet-Namese administration comprise in all: 12 trade schools, 20 domestic science course, 4 institutions providing technical education at secondary level and 3 schools for the applied arts.

Primary vocational training is given in the trade schools and domestic science courses.

Secondary technical training is given in a *collège*, a *lycée* and two apprenticeship centres of a level equivalent to the first cycle of the secondary course.

Along with apprenticeship centres and secondary technical schools, Viet-Nam has organized higher technical schools, such as the College of Radio and Electrical Engineering, the College of Civil Engineering, the College of Industrial Arts and the College of Navigation. These four colleges all belong to a technical centre which has just built at Phù-Tho with very extensive buildings and modern equipment.

The National College of Commerce, founded in 1956, is also placed under the control of the Directorate of Technical Education and Fine Arts.

The extension of vocational training is not the responsibility of the Department of Education alone; the founding of agricultural schools is one of the objectives of the programme of technical reconstruction being applied by the Department of Agriculture.

There are also schools for nurses and medical assistants, which were placed under the authority of the Department of Health by Presidential Decree No. 789 of 18 September 1958.

Private technical training. Alongside the official institutions, there are some 37 private courses for industrial vocational training and many private technical schools. Facilities for technical training are also provided by various firms and big industrial undertakings. The State Railways, for instance, and the rubber plantation companies of Xuân-Lôc, Dau-Tiéng, etc., run their own vocational training courses.

Inspection. Two inspectors of technical training share the task of supervising secondary technical schools and domestic science courses. An inspectorship of musical training has been established in the Directorate of Technical Education and Fine Arts for the supervision of musical instruction in *lycées* and *collèges*, and also in private or semi-official primary and secondary schools. When the inspectorate is brought up to full strength private schools will be more closely supervised from the point of view of general education.

Finance. Since 1955 the Government has spent 32,118,000

piastres on reviving existing institutions for technical training, equipping new workshops, engaging new teachers and drafting a new statute for the teaching body.

A great deal still remains to be done. The Saigon Technical and Art Centre now proposes to equip new workshops, work out technical terminology, and set up commissions for the preparation of technical textbooks. These various projects would require ten times the amount of the credits made available in 1958.

TYPES OF SECONDARY EDUCATION

General secondary schools

The Viet-Namese pupil begins general secondary education around the age of 12 in the 7th class, after completing the primary course, and he leaves school at 18 after completing the 1st class.

On completing the secondary course and passing both parts of the *baccalauréat*, pupils can be admitted, according to their ability, to any of the following higher educational institutions of their choice: Faculty of Arts; Faculty of Law; Faculty of Medicine and Pharmacy; Faculty of Education; College of Architecture; National College of Administration; College of Fine Arts; College of Radio and Electrical Engineering; College of Engineering; Military College.

It is generally while in the *lycée* or *collège* that the pupil is guided as to his fitness for one of the above institutions of higher education.

All Viet-Namese secondary schools open each year in mid-September and close around the end of June. The possibility of making the long vacation coincide with the hottest period of the year is at present being studied.

Time-tables are worked out at the beginning of each school year by the heads of secondary schools, with due regard to the number of hours prescribed for each subject in the syllabus. The dates of holidays and vacations are fixed each year by the Department of Education on the recommendation of the Office of the Director of Education.

Public lycées and collèges. At the beginning of the school year pupils for the 7th class of the national public *lycées* are recruited by means of a competitive entrance examination open to holders of the primary school certificate, between 12 and 15 years of age in the case of boys, 12 and 16 in the case of girls.

The secondary course comprises two cycles: the first cycle, or general preparatory course (from the 7th to the 4th class), which leads to the BEPC; and the second cycle (from the 3rd to the 1st class), in which the pupil can choose one of four different courses, emphasizing respectively modern languages, classical languages, mathematics, and experimental sciences, and which leads to the *baccalauréat*, 1st and 2nd parts.

Pupils obtaining a distinction in the examination for the BEPC at the end of the first cycle are automatically admitted to the 3rd class, the others having to take a competitive entrance examination.

The same syllabuses are applied throughout all secondary schools in the Republic of Viet-Nam.

The following table shows the number of hours being devoted weekly to the various subjects taught in the two cycles of the general secondary course as from the school year 1958/59.

TIME-TABLE FOR GENERAL SECONDARY SCHOOLS
(in hours per week)

Subject	Class

1. Viet-Namese language, literature and culture.

Twice a year the progress of pupils is tested by means of written papers *(compositions)*. The results, together with the observations of the teachers and principal of the school, are forwarded to the parents by means of a school report book. In these papers pupils must obtain the pass-mark for each subject if they are to be promoted to the next grade without an examination. Those who fail to do so sit for a promotion examination at the beginning of the school year.

As already mentioned, pupils in the 4th, 2nd and 1st classes sit for the BEPC, the first and the second part of the *baccalauréat*, respectively. Statistics for 1958 show that 9,265 out of 39,683 candidates passed the BEPC; 2,661 out of 12,913 passed the 1st part of the *baccalauréat;* and 1,307 out of 3,554 passed the 2nd part. The regulations governing these three examinations were laid down by the Departmental Order of 10 January 1955.

Furthermore, Order No. 305 GD/ND of 3 April 1956 set up a Board for the Supervision of Secondary School Examinations. The task of this board is to supervise the work of the examiners by re-examining the papers already corrected with a view to guaranteeing the impartiality of the examinations and thus enhancing the value of the certificates issued by the Government.

After the third reform of education, the Departmental Order of 5 April 1956 laid down the following requirements with regard to modern languages for the *baccalauréat* (1st and 2nd parts): either French or English may be chosen as the compulsory modern language (before promulgation of this Order, French was the compulsory modern language); candidates may also choose a second modern language from English, French, Italian, German, Spanish, or Japanese.

Teaching staff. During the school year 1957/58 successful steps were taken with a view to improving the vocational training and financial status of the teaching body, special attention being paid to the training of primary and secondary schoolteachers.

Graduates of the Faculty of Education, Saigon, *licenciés ès lettres* and *licenciés ès sciences* are eligible for permanent appointment as teachers in general secondary schools. Teachers teach the subjects in which they specialized. To meet the most urgent needs created by the staff shortage that arose in 1957/58, the Department of Education recruited temporary teachers from amongst candidates who had passed both parts of the *baccalauréat* or an equivalent examination, to teach the first cycle in secondary schools.

Vocational and technical schools

Apprenticeship centres. Two apprenticeship centres train qualified workmen for a number of occupations—fitting, boiler-making, ironworking, casting, carpentry, electrical trades, internal combustion engines. The courses now last 3 years, but are to be extended to 4, with the result that pupils will receive a fairly thorough theoretical training, which will enable some of them to continue their studies in schools for foremen.

A survey carried out in the apprenticeship centres enabled the authorities to conclude that the majority of pupils wish to continue their studies in institutions at a higher level, and that in most cases the financial status of the family cannot be regarded as an obstacle to their doing so.

The first-year pupils are selected by competitive examination from amongst candidates leaving the workshop schools and holders of the primary school certificate. At the end of the third year those who pass the leaving examination obtain a vocational training certificate (*Certificat d'aptitude professionnelle*—CAP).

Collège technique. This is a first cycle technical secondary school which trains pupils who will eventually become foremen in industry when they have had the necessary experience. The *collège technique* at Hué recruits its pupils (about 300 for the school year 1958/59) by competitive examination from amongst holders of the primary school certificate aged not less than 12 and not over 16. The syllabus for the 7th and 6th classes is general education and vocational guidance, and for the 5th and 4th classes, vocational training and specialization.

The special branches from which pupils may choose are fitting, casting, boiler-making and welding, carpentry and joinery, electricity, internal combustion engines, steam engines. The course leads to the Certificate of Industrial Training (*Brevet d'enseignement industriel*).

Lycée technique. This school offers both cycles of technical secondary education. It has the dual function of providing vocational education for boys—and in certain cases for girls—who will occupy intermediary positions in the industries and crafts, and technical secondary training up to *baccalauréat* level and leading to higher education.

The *lycée technique* at Saigon, which now has 1,554 pupils, recruits them by competitive examination from amongst holders of the primary school certificate aged not less than 12 and not over 16. After a multi-purpose course lasting 2 years, pupils have to choose between two branches: the 'mathematical' branch, extending over the 5th, 4th, 3rd, 2nd and 1st classes; and the 'industrial' branch, extending over the 5th and 4th classes.

The syllabus applied in the classes of the 'mathematical' branch are aimed at giving pupils some idea of technology and draughtsmanship together with a good foundation of physics and mathematics.

The 'industrial' branch leads to the Certificate of Industrial Training; the 'mathematical' branch leads to the *baccalauréat technique*, which is recognized as equivalent to the general education *baccalauréat*.

Applied art schools. Three schools of applied arts, at Gia-Dinh, Biên-Hoà and Thu-Dau-Môt respectively, take some 455 Viet-Namese pupils. These schools are responsible for training qualified workmen and artisans capable of reviving traditional Viet-Namese arts and crafts, as well as designers or technicians capable of assisting heads of undertakings and becoming talented decorators.

The special branches taught at the Gia-Dinh School of Applied Arts fall into the graphic arts section (drawing, engraving and lithography) and the building section.

The Biên-Hoà School of Applied Arts teaches ceramics, bronze-work and moulding.

Finally, the recently founded School of Applied Arts near Hué gives instruction in no less than five special branches—cabinet-making, decoration, furniture designing, sculpture and lacquer work.

In all these schools the courses last 4 years. The curricula comprise some general educational subjects, some technical and some vocational. Pupils are recruited by competitive examination from amongst holders of the primary school certificate aged not under 14. The courses lead to a Certificate of Applied Arts.

Higher technical schools. These provide more highly specialized training at a more advanced level than the *collège technique* or the apprenticeship centre.

The National School of Commerce provides boys and girls with the training in technical, economic, legal and social questions which is indispensable in the civil services, commerce, industry and banks. The course is arranged in such a way that after the essential period of probation for gaining experience, graduates are in a position to rise to managerial posts. The top 15 graduates each year have the option of entering the administration.

Pupils are recruited by competitive examination from amongst holders of the *brevet d'études du premier cycle* (BEPC), or some other certificate of intermediate standard. A quarter of the total number of pupils are admitted without sitting for the examination: these are secretaries in national services who have been recommended by their superiors, and ex-servicemen who have served over two years in the armed forces. Candidates recruited in this way must hold the same certificates as those recruited by examination. The course covers 3 years and leads to the Certificate of Commercial Studies.

The National School of Agriculture, founded at Blao in September 1956 and inaugurated in December 1956, has so far enrolled 148 regular students and 26 *auditeurs libres* (students not entitled to sit for the examinations).

At the first graduation some 50 students obtained their certificate after three years of theoretical and practical studies and six months' probation in the Department of Agriculture's special stations.

The School of Applied Agriculture at Cân-Tho was inaugurated at the beginning of the school year 1957/58 with an enrolment of 63 students, including 13 from amongst the ethnic minorities of the plateau region in Central Viet-Nam.

Teacher training schools

The National Teacher Training School (École Normale Nationale), now transferred to Saigon, recruits pupils by competitive examination from amongst holders of the BEPC. They take either an accelerated training course lasting 1 year, or the normal 3-year course. Those who take the accelerated course and pass the examination at the end of the year obtain a Certificate of Proficiency in Teaching (*Certificat d'aptitude pédagogique*), which entitles them to appointments as teachers in primary schools with civil service rank. Those who pass the examination at the end of the 3-year course are qualified to take complementary (primary continuation) classes and may be appointed on a temporary basis to teach the first two grades of the first cycle of the secondary course.

A branch of the National Teacher Training School at Saigon operates at Banméthûot for the benefit of the ethnic minorities from the plateau regions. In the school year 1957/58 some 30 primary school teachers were trained there.

The curricula, laid down by departmental order, extend over three years and correspond more or less to those of the second cycle of the secondary course. The syllabus includes the following subjects: Viet-Namese, French and English, ethical instruction and civics, history and geography, mathematics, physics and chemistry, natural sciences, theory and practice of teaching, child psychology, handicrafts and drawing, school administration, professional ethics, music, physical culture and youth activities, agriculture, hygiene.

The staff of teacher training schools is recruited at present from amongst inspectors of primary and secondary schools, who are assisted by a certain number of lecturers. The model classes are taken by the most experienced men and women teachers.

Other specialized schools

The National Conservatory of Music at Saigon, founded in October 1956, trains musicians and music teachers for the different educational levels.

Out-of-class activities

Every secondary school must have its youth group, in which civic, ethical and physical training complement the general instruction given at school. Regulations governing these youth groups were promulgated in Departmental Order No. 270 GD/ND of 21 February 1957.

During the school year 1957/58 and at the 1958 National Congress of Education, the question of the reorganization of youth groups was debated at length, and a practical programme likely to be of great service to educationists was drawn up.

The Department of Education also organized three training camps for teachers acting as youth leaders. Some 500 teachers participated.

Physical culture and sport have been very much encouraged in secondary schools. For the best performances of the secondary schools' sports associations, prizes have been awarded annually since 1957. Furthermore, pupils who hold the Sports Certificate receive a 'bonus' of a maximum of 13 marks at the BEPC, or intermediate examination.

Finally, in the summer of 1958 a course was inaugurated at Nha-Trang for initiating inexperienced teachers into physical culture and sports methods and youth activities.

Since the school year 1955/56 four holiday camps have been organized annually in the hills or at the seaside for some 3,000 to 5,000 pupils. Excursions are also arranged by heads of secondary schools on the occasion of different festivals.

Most secondary schools have their own savings bank, which allows the setting up of school co-operatives and canteens, and the raising of funds for worthy causes. Parents generally make a considerable financial contribution to these out-of-class activities.

TRENDS AND PROBLEMS

The National Government is still making great efforts to extend general secondary education and establish a network of technical schools and art schools to meet the requirements of a young independent State.

The carrying out of this programme for extending education is of course subject to budgetary resources.

Building new schools is a relatively easy problem to solve, for it involves only one outlay of money. However, finding the credits for teaching staff and salaries is a serious problem.

Public secondary schools were very short of teachers for the school year 1957/58. The Department of Education was then obliged to recruit teaching assistants paid by the hour and to ask all teachers, both permanent and those engaged on a contractual basis, to do a considerable amount of overtime.

It is the task of the Faculty of Education at Saigon to train secondary school teachers, a number of whom also come from the Faculties of Sciences and Arts. To overcome the shortage of teachers, the Department of Education contemplates setting up a centre which would combine all the teacher training schools. Secondary education cannot progress until it has the necessary staff, so the building of new schools and the opening of new classes can only be a gradual process. Moreover there is still the task of providing the existing schools with the teachers they lack, organizing sufficient classes so that pupils completing the first cycle of the secondary course may continue their studies in the second cycle, and expanding accommodation in the first cycle so that holders of the primary school certificate, the number of whom increases yearly, may be able to enter secondary schools.

New school buildings are mainly required in those provinces which have no national secondary institutions, and in the plateau regions of Central Viet-Nam, where the Government's plan for extending education is to be applied.

The Office of the Director of Primary, Secondary and Popular Education has prepared and submitted to the Secretary of State for Education a draft five-year plan for the extension of secondary education. If this plan is approved and implemented, in 1963 Viet-Nam will have 1,933 secondary classes with an enrolment of 106,000 pupils.

All the nation's resources must be mobilized in order to extend general education, build up technical education and hasten the industrialization of the country.

STATISTICS

Population (mid-year 1958 estimate): 12,800,000.
Area: 65,948 square miles; 170,806 square kilometres.
Population density: 194 per square mile; 75 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, school enrolment (not including some 476,000 persons attending adult education courses) reached a total of 975,000 pupils, which was about 8 per cent of the total population. Of these pupils about 1.5 per cent were in pre-primary schools, 87 per cent in primary schools, 11 per cent in all types of secondary schools, and 0.5 per cent in higher education. The proportion of girls was 38 per cent in primary schools, 32 per cent in secondary schools, 31 per cent in teacher training schools and 18 per cent in higher education faculties other than the faculty of education. Women teachers constituted 34 per cent of the teaching staff in primary schools, 16 per cent in secondary schools. The average number of pupils per teacher was 57 in the former and 33 in the latter. Between 1953 and 1957, there was a 51 per cent increase in primary school enrolment, while the enrolment in general secondary schools and institutions of higher education faculties more than doubled. (See Table 1.)

Enrolment trends in secondary education, 1950–57. All types of secondary education grew rapidly during the period 1950–57. While the rates of growth in vocational and teacher training enrolment were much higher than in general secondary education, the last type of education still predominates. The proportion of girls in teacher training has diminished from one-half or more to less than one-third, which is also the proportion in general secondary schools. Girls do not seem to take up vocational education to any large extent. For the period 1955–57, the average total enrolment in all types of secondary education did not quite reach 6 per cent of the estimated population 15–19 years old. (See Table 2.)

Examination results in secondary education, 1953–57. In the two main categories of certificates—the *brevet* (secondary school, lower stage) and the *baccalauréat*, first part—the number increased four and a half times between 1953 and 1957. The number of students completing the second part of the *baccalauréat* also increased more than three times. The most rapidly increasing category was that of primary school teacher training certificates, which multiplied more than eight times during this period. In the categories of vocational training certificates, technical school diplomas (radio, electricity) and school of navigation diplomas, there were notably fewer recipients in 1957 than in 1953. (See Table 3.)

Educational finance, 1957. For the fiscal year beginning in January 1957, total recurring expenditure for education was budgeted at 533.5 million piastres, or an average of 43 piastres per inhabitant. The distribution of this budget by level and type of education is shown in Table 4.

NORTH VIET-NAM

THE EDUCATIONAL SYSTEM

In 1950 the educational system was reformed in terms of both structure and content, with the setting up of a 9-year unified school of general education; this was organized in three stages (4-3-2). At the beginning of 1956 the General Education Congress recommended the extension of the general school course to 10 years (4-3-3), and laid down the principles for a general reorganization of the teaching. In the following year new regulations for the 10-year school were adopted.

Many children attend a preparatory or pre-primary class before entering the 10-year school proper. On the completion of the successive levels of the general school pupils may enter different types of vocational and technical education. A reorganization of higher education was begun in 1956 with the consolidation of two higher teacher training schools into a Pedagogical Institute, the founding of a university, which among its functions trains teachers for the third (upper secondary) stage of the 10-year school, a Polytechnical College and a College of Agriculture and Forestry. Of more recent foundation are the College of Fine Arts, the College of Economics and Fine Arts at Hanoi, and a Teachers' College at Vinh.

Extensive provision has also been made for the general and vocational education of adults.

TYPES OF SECONDARY EDUCATION

General secondary schools

The purpose of the schools of general education is to produce workers of a new type, imbued with socialist ideals,

TIME-TABLE FOR GENERAL SECONDARY SCHOOLS
(2nd and 3rd stages of 10-year school; in 45-minute periods per week)

possessing a good fund of general and technical knowledge, and enjoying good health.

The school year lasts 8 months and comprises 30 weeks of classroom instruction and productive work, the latter consisting of a 4-hour period every week.

The curriculum in the 2nd and 3rd stages of the 10-year school is given in the precedent table.

In addition, one period a week is devoted to physical education in schools which have an instructor.

Vocational and technical schools

Technical schools (technicums) admit pupils who have completed 7 years of general education, and offer 3-year courses in various specialities. There are at present 13 technicums training technical staff for the railways, post and telegraph services, public health, water transport, agriculture, building, metal-working and machine construction, mining, etc.

Teacher training schools

There are several levels. The institutions which train teachers for grades 1 to 4 admit pupils who have completed grade 4 and give a 3-year course. There are also 1-year training schools based on completion of the 7-year school.

Teachers for grades 5 to 7 and grades 8 to 10 are trained in institutions at upper secondary and higher level.

TRENDS AND PROBLEMS

During the three-year plan from 1958 to 1960 education is to be expanded and the quality raised. The basic principles are the need to combine harmoniously theory and practice, teaching and productive work.

[*Text prepared by the Unesco Secretariat in June 1960.*]

STATISTICS

North Viet-Nam has a population of 15 millions (mid-year 1958 estimate) to an area of 59,924 square miles or 155,203 square kilometres. In the absence of officially published statistics known to the Unesco Secretariat, the following data may be quoted from a recent source: P. I. Samoukov, 'Razvitie narodnogo obrazovanija v Demokratičeskoj Respublike V'etnam', *Sovetskaja pedagogika*, Moskva, Akademija pedagogičeskoj nauk RSFSR, No. 5, May 1960, pp. 64–72.

YEMEN

The graded school system is a recent development in Yemen. The full primary course lasts 6 years but all six classes are not yet to be found in most schools. General secondary education, introduced in 1955, provides for a 6-year course divided into two cycles, intermediate and secondary proper. The only form of technical education is a class for radio operators annexed to the secondary school at Sanaa. There is also an institution for training office workers which was set up in 1958 and annexed to the Sanaa intermediate school. In addition to these secular schools, there is a religious educational system, in which the full course of study, predominantly theological, lasts 12 years. A comparatively large number of Yemeni students receive their education abroad at both school and university levels.

TRENDS AND PROBLEMS

Owing to the long isolation of the country there are many problems to be overcome before a satisfactory national educational system can be developed. The heavy drop-out

of school children in the upper primary school grades, in the few schools where these grades exist, is due to the unsuitability of the present curriculum and methods, to lack of interest on the part of parents and to the need for boys to help with the work in the fields. The lack of well-organized curricula at primary level is partly responsible for the inadequate standards of pupils' work in the secondary schools. Another contributing cause is the fact that, with the exception of a few teachers recruited from other Arab countries, teachers in the schools of Yemen are not yet sufficiently well qualified. Basic problems therefore include the general revision of the content and methods of teaching at all levels as well as the provision of more schools and the training of teachers. As agriculture is the country's main source of wealth there is an urgent need for appropriate vocational schools. For some time to come Yemen will have to rely on recruiting expatriate teachers and on sending many of its own nationals abroad for education and training.

[*Text prepared by the Unesco Secretariat in January 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 4,500,000.
Area: 75,290 square miles; 195,000 square kilometres.
Population density: 60 per square mile; 23 per square kilometre.

No new information on school enrolment and educational finance has become available since the publication of *World Survey of Education: II—Primary Education*, which contains data on Yemen for 1956.

YUGOSLAVIA

THE EDUCATIONAL SYSTEM

The educational system of the People's Federative Republic of Yugoslavia is based on the principle of the equality of all citizens and planned in the light of the aims of a socialist society. The basic institution is the primary school, providing an 8-year course, which is compulsory for all children between 7 and 15 years of age. The secondary schools include various general and vocational schools. The higher professional schools, the schools of fine arts and the universities represent the third level of the educational system. There are also schools at which adults can receive general education and further vocational training.

The different levels are not enclosed in watertight compartments. Citizens who prove their ability by passing a special examination may be admitted to the university even if they have not had the usual pre-university schooling.

The flexibility of the system is most evident in the secondary schools, which do not rank in importance according to the length of the course they provide or their speciality. All these schools are important to the general community, for each is designed to meet a specific social need, whether it trains skilled workers, technicians or teachers. Vocational schools, once backward and underrated, are now assuming great importance in the present stage of intensive economic development, and a basic reform of vocational education is being carried out.

Under the 1946 Constitution, schools and other educational establishments must be open to all sectors of the population; this implies not only the absence of any discrimination in pupil enrolment, but also the extension of compulsory schooling to all children. Education is free of charge and the community provides the most gifted pupils with the means of continuing their studies through all three levels. The Constitution lays down the principle that the school shall be separated from the Church and that the opening of private schools must have legal sanction. There are in fact no private schools.

The general education law, adopted in 1958, defines schools and other educational establishments as independent institutions organized on the principle of self-government. The school is a factor in the life of society, not only because it is a specially important social institution, but also on account of its structure, the way it is controlled (through school committees) and, lastly, by reason of the close co-operation established between itself and the municipality or social unit to which it belongs and whose day-to-day problems it shares.

The People's Federative Republic of Yugoslavia consists of six federated people's republics—Serbia, Croatia, Slovenia, Bosnia-Herzegovina, Montenegro and Macedonia —in which the inhabitants are of five nationalities (Serb, Croat, Slovenian, Macedonian and Montenegrin). In the schools of each republic, the medium of instruction is the children's mother tongue, except in the universities and higher professional schools, each of which uses the language

of the people of the republic in which it is situated—Slovenian in Slovenia, Macedonian in Macedonia or Serbo-Croat in the other republics. However, this diversity of nationalities and languages is no obstacle to the unity of teaching methods and of the general aims of education. The unity of the educational system is guaranteed by the laws and instructions of federal bodies, including the Higher Council for Public Education in Yugoslavia, which concerns itself with educational plans and curricula. On the basis of these general instructions, education councils of the republics draw up curricula and syllabuses for the various types of schools. The unity of the system does not, however, imply uniformity of schooling. The municipal education councils may adapt the primary curriculum to meet regional needs and the circumstances of each particular school.

THE DEVELOPMENT OF SECONDARY EDUCATION

Until the end of the first world war, the peoples of Yugoslavia lived in different states. Apart from the independent kingdoms of Serbia and Montenegro, the majority of these peoples were under Austro-Hungarian rule (those living in Croatia, Slovenia, Vojvodina, Slavonia and Bosnia-Herzegovina) or Turkish rule (Macedonia, Kosovo-Metohia and part of South Serbia, until 1912). After the first world war, the dismemberment of the Austro-Hungarian Empire made it possible for the Yugoslav peoples to realize their long-cherished hopes of unification in a single state (December 1918).

During the early post-war years, most of the schools retained the policies and curricula in force in the states to which they had belonged before the creation of Yugoslavia. The 10 years following its establishment (up to 1929) were, in fact, marked by protracted political dissensions over the reorganization of the educational system. The main aim of the new system, established under the 1929 laws, was the unification of schools. The law on public schools set up the compulsory primary school with an 8-year course divided into two stages—four elementary classes and four upper primary classes. After completing the 4-year elementary stage, children could go on to the higher classes of the same school or else to an academic secondary school (*gimnazija* or similar establishment). Teaching was free in the schools providing an 8-year course. However, it should be pointed out that a high proportion of children did not even go through the elementary stage, a fact which accounts for the millions of illiterates who raised a serious problem for Yugoslav education after the second world war. The upper primary and complementary schools trained their pupils for commerce, trades, industry and agriculture or prepared them for the secondary vocational schools. The *gimnazije* and similar schools provided a partial 4-year course and a full 8-year course. At the end of the fourth year, pupils sat for an examination known as the 'little baccalaureate', and at the end of the eighth year they sat for the leaving examination or full baccalaureate. To transfer from upper primary and complementary schools to the upper classes of a *gimnazija*, pupils had to pass an entrance examination.

Little provision was made for vocational teaching, as the country's economic backwardness and semi-colonial position limited the need for highly trained staff. In 1929, a law on teacher training schools, which were all state-run boarding establishments, increased their course from 4 to 5 years. They accepted only pupils who had passed the 'little baccalaureate' and a special entrance examination.

The 1929 educational legislation remained in force until the German invasion of Yugoslavia in April 1941. Yugoslavia was then parcelled up and occupied by Germans, Italians, Hungarians and Bulgarians. Many schools were closed throughout the war, some continued to operate though with frequent interruptions, and others laboured under very difficult conditions.

At the close of hostilities, education was in a critical situation. A large proportion of the population (approximately one-third) was illiterate, the teaching staff had been seriously depleted and about 50 per cent of the school buildings had been damaged or destroyed. To solve these difficult problems and to apportion the limited financial resources on a systematic basis, a centralized system of control for education had to be adopted in the post-war years.

Schools and general scientific and cultural institutions were controlled by each republic's Ministry of Education and those of departments and districts by the local education councils. The Ministry had the exclusive right to open schools, to appoint and transfer teachers, to distribute funds and control their use, to draw up educational plans and curricula and to approve textbooks. The vocational schools were controlled by different ministries, according to the special subjects taught. However, after 1947, the Ministry of Education assumed control of a number of vocational schools and, in 1948, a Department of Vocational Education was set up.

The general distinguishing features of education during this period were the extension of the period of compulsory schooling, the large increase in the number of pupils from the proletariat in all schools, the sharp rise in the number of schools, the rapid growth of vocational training, and the large share taken by the people in the control of public education.

In 1950 the adoption of the basic law on the control of state enterprises, economic enterprises and economic co-operatives by workers' associations, marked the beginning of the process of administrative decentralization. The year 1953 saw the adoption of the basic constitutional law on the social and political organization of the People's Federative Republic of Yugoslavia and on the federal organs of authority, which laid the foundations for the decentralization of the state's powers. The system of self-government was then extended to all spheres of social life. In 1955, for instance, the general law on the control of schools was adopted. The agencies of local self-government, such as school committees and municipal and district councils for education, then assumed control of the schools. The 1958 general law on public education continued the democratization of education by introducing further reforms.

Legal basis

The 1958 general law on public education is the basis of present school legislation. This general law allowed a

period of one year for the framing of a law on primary schooling and of a law to govern the *gymnazije*, and a period of two years for the framing of a general law on secondary and higher vocational schools and teacher training. In 1959, the National Assemblies of the People's Republics had already passed the laws on primary schools. The bills on *gymnazije* are still under discussion and should be adopted by 1 September 1959.

The law on compulsory schooling, adopted in 1955, requires all children between 7 and 15 to attend primary school regularly. The penalty for infringement is a fine of 10,000 dinars imposed upon the parents or guardian, the headmaster of the school or any other person in charge of a child, who, through negligence, allows the child to stay away from school for no valid reason. If found guilty a second time, the person responsible is liable to imprisonment (up to 30 days).

The situation of apprentices is governed by special provisions. Any person is regarded as an apprentice, who, in a factory, shop, crafts centre, or workshop, learns a definite occupation or trade. The apprentice is instructed by a trained worker in the occupation he wishes to follow, or by a master craftsman or the manager (in the case of a shop). At the beginning of the apprenticeship, the director of the enterprise concludes a contract with the apprentice. The latter receives a monthly wage and may not be employed on work unrelated to the trade or occupation he wishes to learn. Apprentices are not allowed to work at night or overtime. The normal period of apprenticeship to certain professions or trades is three years, after which the apprentices pass an examination. The period of apprenticeship to a very few professions or trades may be either two or four years. Each year, apprentices are entitled to 30 days holiday during the summer school holidays and 7 days during winter school holidays. They are required to have a medical examination at the beginning of their apprenticeship and at least once a year throughout the period of training. Apprentices may not be subjected to physical punishment. After passing a final examination, the apprentice is recognized as a skilled worker, a journeyman craftsman or a shop assistant. The local people's committee may, on its own initiative or on the proposal of the competent chamber of commerce or labour inspectorate, prohibit the retention of apprentices in enterprises which fail to provide the requisite facilities.

Administration

The Higher Council of Public Education is the highest educational authority in Yugoslavia. Its function is to work out the general outline of educational plans and curricula, to formulate general principles for the preparation of textbooks, to make suggestions and to consider general questions concerning the development of formal and general education. If need be, it draws up recommendations and conclusions and advises on the handling of problems falling within its competence. Some of the members of the Higher Council of Education are appointed by the Federal Executive Council (Cabinet), while the others (three for each federated republic) are chosen by the education councils of the different republics.

These councils adopt, in accordance with the general policy laid down by the Higher Council of Public Education, the education plans and curricula of all schools within the territory of the republic for which they are responsible. They are also responsible for the approval and publication of textbooks and other teaching aids.

The Federal Institute for the Study of Educational Questions and the institutes for the development of education in each federated republic study the various educational problems arising, particularly those relating to teaching methods. In handling these problems, they are guided by the latest experience and educational theories.

Control. In accordance with the general tendency for the State to hand over its functions of control to smaller units, collective local control has also been introduced in schools. There are five levels of administration: the school, the municipality, the district, the constituent republic and the Federation.

Each school is, by common consent, controlled by a school board elected for a period of two years to handle all matters affecting the day-to-day life and operation of the school. Each board consists of a number of members appointed by the municipal people's committee and by the council of school teachers, together with members elected from among the citizens living in the area served by the school, and delegates of economic and social organizations and other interested associations or institutions. The headmaster of the school is an *ex officio* member of the school board, on which a fixed number of pupils, chosen by their classmates, also serve. The membership of each school board depends on the type of school. The chairman may not be either the school head or one of its teachers. The headmaster of each school is responsible for the organization of school work, supervises the work of teachers and is the school's legal representative.

Each municipal people's committee is responsible for opening primary schools within its area and providing the funds required for their operation and upkeep. It has also the duties of appointing the headmaster of each school, enforcing school attendance, arranging for the development of education in the municipality, etc. Each municipal committee has an education council which handles specifically educational matters; this council issues instructions for all bodies responsible for the control of education, advertises competitive examinations for the recruitment of teachers, considers the annual report on the work of schools, approves the regulations for schools and circulates among the competent bodies any general recommendations concerning schools. The education council consists of at least two members chosen by and from among the members of the municipal people's committee, a number of members of the school board chosen by their colleagues, a number of representatives of trade unions, economic and social organizations, youth organizations, professional associations and institutions designated by the municipal people's committee, together with a number of persons taking an active part in public life, who are appointed by the municipal people's committee. The director of education is an *ex officio* member of the council and serves as its secretary.

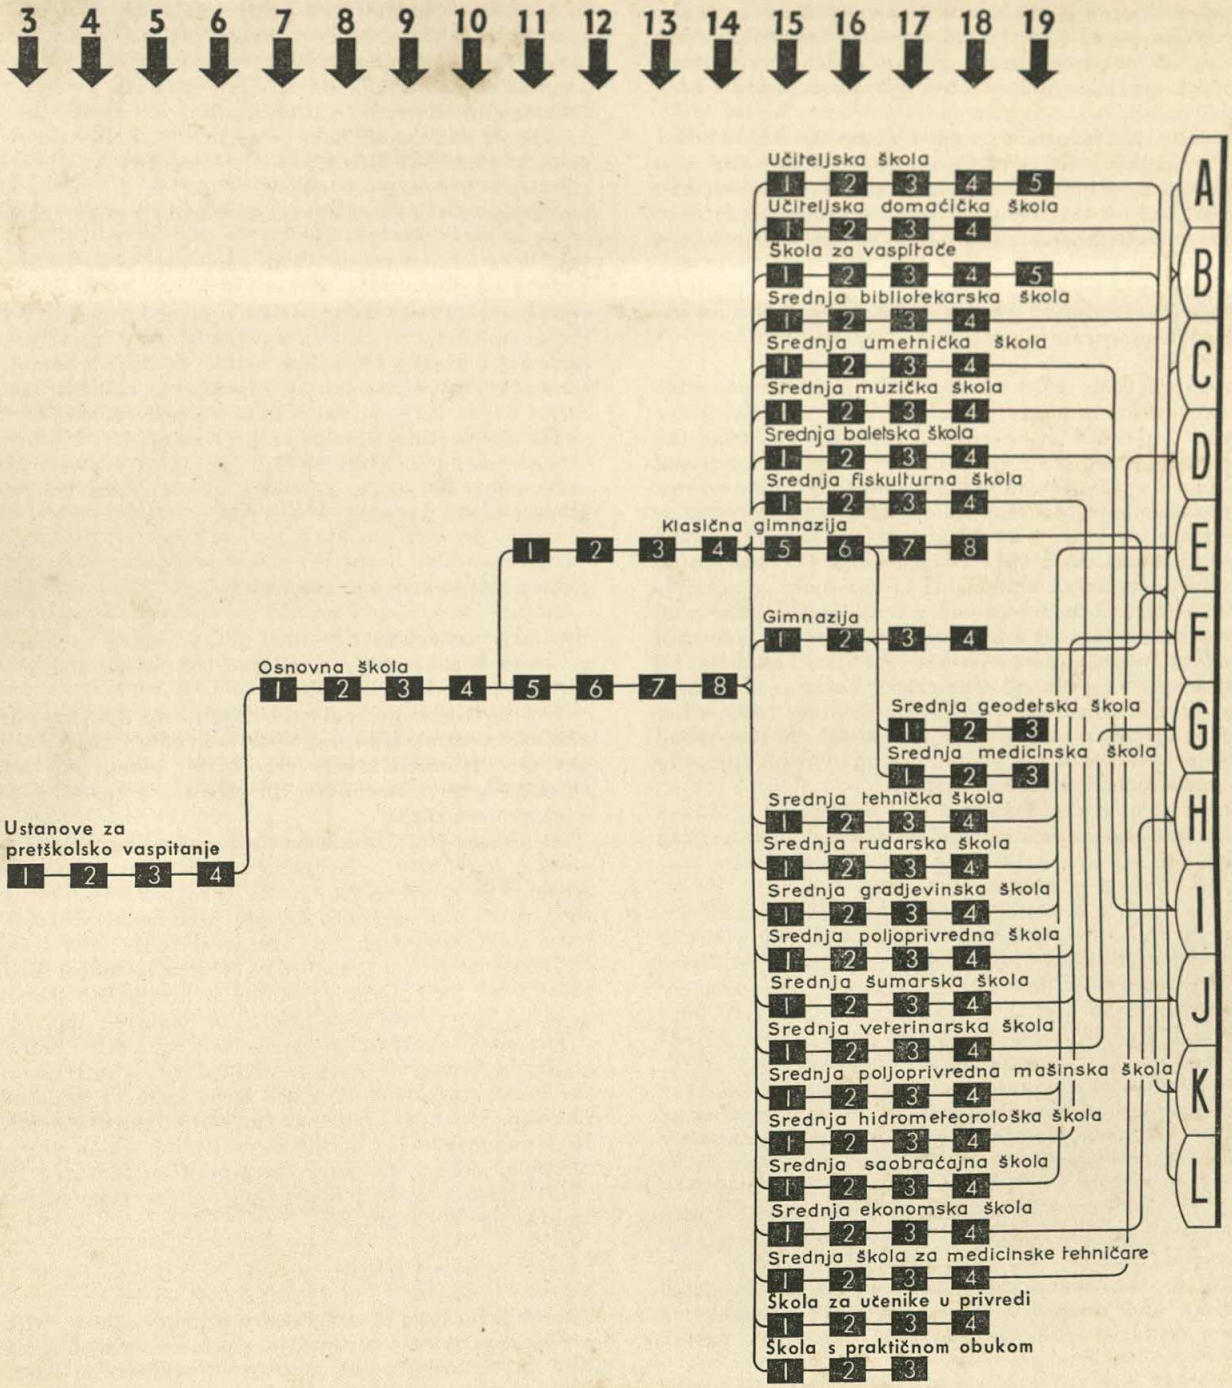
The district people's committee discusses general questions concerning the development of education within

the district. It can set up *gimnazije*, vocational schools, special schools, and other establishments for which it must provide the necessary funds. The education council of the district people's committee consists of at least two members of this committee, a number of members chosen by the education councils of the municipalities in the district, a number of delegates of trade unions, economic and social organizations and youth organizations, professional associations, chambers of commerce and institutions designated by the district people's committee, together with persons taking an active part in public life, who are appointed by the latter committee. The head of the school inspection service of the district people's committee serves on this council, as does also the director of education, who acts as its secretary.

Each republic also has an education council which considers the general educational situation throughout the territory of the republic, together with draft legislation and other provisions concerning education, and arranges for their study, proposes a programme for the development of *gimnazije*, vocational and special schools, and sees that it is carried out. The education council of each republic is responsible among other things for the pre-service and in-service training of teachers, and, for this purpose, it runs a professional training centre, keeps up-to-date statistics of teachers and educators in the republic's territory and lays down standards for school buildings and equipment. This council consists of a number of members appointed by the Executive Council of the Republic from its own members, of teachers and health officers, and of other persons taking an active part in public life, a number of members of the education councils of district people's committees, delegated by these councils, a number of delegates of the republic's council of trade unions, youth organizations, professional associations and other interested organizations. The council's secretary is an *ex officio* member.

The Federal Executive Council has a Secretariat for Education and Culture which deals with general educational questions of concern to the whole country, but the actual control of the educational system is decentralized. Other organizations also take part in the discussion of educational problems of concern to them, through their delegates on education. They may also assist in financing schools in which they are interested.

Supervision and inspection. The inspection service is concentrating more and more on giving enlightened assistance to teachers, on putting forward recommendations to guide them in their work and encourage them to display initiative, and, lastly, on helping to solve practical educational problems. Accordingly, one of the service's main duties is to keep under regular review the results obtained in educational theory and practice. However, the inspection service continues to see to it that provisions relating to the organization and operation of schools are complied with and that schools and similar institutions adhere to educational plans and curricula.



These functions are discharged at the district level by the inspection service responsible to the district people's committee and, in each of the republics, by the Institute for the Development of Education. They are entrusted to educational advisers chosen from among outstanding teachers and education specialists with the requisite

GLOSSARY

gimnazija: general secondary school.
klasična gimnazija: general secondary school with classical course.
osnovna škola: primary school.
škola s praktičnom obukom: practical vocational training school.
škola za učenike u privredi: vocational training school for apprentices.
škola za vaspitače: pre-primary teacher training school.
srednja baletska škola: vocational training school of ballet dancing.
srednja bibliotekarska škola: vocational secondary school for librarians.
srednja ekonomska škola: vocational secondary school of commerce.
srednja fiskulturna škola: vocational secondary school of physical education.
srednja geodetska škola: general secondary school for land surveyors.
srednja gradjevinska škola: vocational secondary school of building and public works.
srednja hidrometeorološka škola: vocational secondary school of meteorology.
srednja medicinska škola: vocational secondary school for nurses and other health workers.
srednja muzička škola: vocational secondary school of music.
srednja poljoprivredna mašinska škola: vocational secondary school for specialists in agricultural machinery.
srednja poljoprivredna škola: vocational secondary school of agriculture.
srednja rudarska škola: vocational secondary school of mining.
srednja saobraćajna škola: vocational secondary school for transport technicians.
srednja škola za medicinske tehničare: vocational secondary school for medical laboratory workers, radiologists, etc.
srednja šumarska škola: vocational secondary school of forestry.
srednja tehnička škola: vocational secondary school.
srednja umetnička škola: vocational secondary school of fine arts.
srednja veterinarska škola: vocational secondary school of veterinary science.
učiteljska domaćička škola; specialized training school for teachers of home economics.
učiteljska škola: primary teacher training school.
ustanove za pretškolsko vaspitanje: institutions for pre-primary education.
viša gimnazija: upper general secondary school.

professional training and length of service, whose work has been instrumental in the development of educational practice. The educational advisers of each republic's inspection service are appointed by that republic's education council.

Not only the inspection service but also the school board keeps a check on the school's operation. The board also exercises general supervision over the use of public property administered by the school; it considers complaints from parents, teachers and pupils, as well as petitions and proposals from citizens on any matters relating to the school. Enforcement of legal provisions in all schools, apart from the higher professional schools, is the responsibility of the municipal council for education.

Finance. The body which sets up a school must also provide the funds for its operation and upkeep. The funds for schools established by state bodies are derived from the budget of the municipality or district. Additional financial resources may also come from endowments by state organs, institutions, industrial and community organizations, or from funds specially raised for the purpose. The school board draws up the budget estimates and forwards them, with an explanatory statement, to the body responsible for the budget of the municipality or the district. The total appropriations for each school are included in the municipal or district budget under two heads—salaries of teachers and other school expenditure. The school board is obliged to show, in the estimates it sends to the state body, what extra-budgetary resources may be available to the school. The final operational budget is drawn up by the headmaster and approved by the school board.

The cost of school buildings and equipment is always met by the body which established the school. Interested institutions or industrial organizations may also contribute towards the cost of building the school.

The country's economic development calls for an increase in the number of vocational schools, for which a heavy financial outlay is needed. Accordingly, funds for the development of the various sectors of the economy have been established, their resources being derived from industrial organizations. From the outset, these funds were set up in the various branches of the economy, which led to decentralization in their management. In 1955, they were employed mainly for improving working and living conditions in vocational schools and hostels and particularly in these schools' workshops. In 1956 and 1957, these funds were also used for the building and equipment and even partly for the upkeep of vocational schools (together with their workshops and hostels) and other establishments for vocational training. In 1957, consolidated funds were instituted—the federal fund, the funds of the federated republics and district funds—so that the available resources could be used wherever they were most needed, regardless of their origin.

In 1959, part of the contributions from industrial organizations was left at the disposal of those organizations, to enable them to spend larger sums on the building and equipment of vocational schools and other establishments providing general or advanced vocational training.

Education is free of charge. Working parents receive an allowance for each child who regularly attends school and successfully completes each year's study; these allowances are paid until the student concerned has completed a university course. Particularly gifted children of needy parents obtain scholarships. State welfare services are provided for all pupils. A health service has been organized in schools and pupils have a medical examination every year; if they fall ill, they are treated free of charge in children's hospitals or clinics. There is an educational psychology service for both primary and secondary schools.

Buildings and equipment. The education councils in the various republics lay down standards for the building and equipment of schools. According to the rules in force, classrooms must be able to accommodate 36 to 42 pupils, each pupil having 1.5 square metres of floor space and a total space of 5 cubic metres. In school workshops, laboratories, etc., each pupil must have 2 square metres of floor space. The lighting provided for a classroom is 250 lux.

The Federal Institute for Teaching Aids prepares model aids, which it submits to the Higher Council for Public Education for approval.

TYPES OF SECONDARY EDUCATION

Secondary schools may be divided into several categories—general schools, teacher training schools, vocational schools, art schools and special schools.

For the time being, only the large towns have vocational guidance centres. However, courses in educational psychology are organized in the schools for parents to enable them to help their children in choosing a special field of work or occupation.

At the end of their secondary schooling, pupils may enter a university or a higher professional or vocational school. The choice of the faculty or higher school in which they enrol is determined by the vocational school they have been attending. For instance, those who leave a secondary technical school may enter a technical faculty, those who have been attending a secondary school of medicine may enrol in a faculty of medicine, and so on.

The school year, which begins on 1 September and ends at the beginning of June, is divided into two terms, and the main school holidays are from June to September. The winter holidays begin at the end of the first term, on 15 January, and last for 20 days, during which pupils go camping, skiing, etc. They have between four and seven hours' lessons a day, depending on the type of school and the age of the pupils.

General secondary schools

The uniform type of compulsory primary school, with an 8-year course, not only provides primary schooling but is also the starting point for further studies, so that the usual classification of levels of education is not applicable to the Yugoslav educational system. In Yugoslavia secondary education proper caters for pupils between 15 and 19 years of age.

Grades 5 to 8 of the uniform primary school. The primary school has a twofold purpose—to lay the foundations of a

socialist education for the younger generation, and to provide it with general modern schooling. To attain these aims, the school gives the pupils a scientific approach to the world, teaching them the history of human society in general and of the Yugoslav peoples in particular, together with the results achieved in the various fields of science, technology, culture and art, fostering in them an awareness of the creative power of the human mind and developing their capacity for learning and the individual pursuit of knowledge. In addition, the school should inculcate in young people a sense of their responsibility towards society.

The subjects taught in the upper classes of the primary school are the mother tongue, natural sciences (physics, chemistry, biology) and mathematics, the general principles of technical education, social studies (geography, history and socialist ethics), foreign languages, physical and health education, art education, music and domestic science.

A special committee of the education council is responsible for marking the results of pupils' work (on a 5-point basis). To move up automatically into the next class, pupils must not have a low mark in any subject; if they have no more than two low marks, they can sit for a supplementary examination; if they have three low marks, they must repeat the year. In the primary school, examinations may be taken outside the normal sessions by pupils who have been prevented by prolonged illness or for any other valid reason from attending school regularly. This special rule is designed to enable pupils to catch up on time lost in their studies. It is also applicable to the examinations for promotion from one class to the next. The supplementary examinations are held at the end of August. Primary school pupils may not be dismissed throughout the period of compulsory schooling.

In the upper classes of the primary school, the pupils are taught by course instructors or full teachers. Course instructors must hold the diploma of the Senior Teaching Training School, while full teachers must hold a university degree in arts or science. Teachers are appointed by the municipal council for education and are recruited on a competitive basis. Full teachers and course instructors, who are normally up-graded every three years, must pass a professional examination within five years of their appointment in order to qualify for promotion. Teachers may be up-graded two steps if they have obtained the highest marking during three consecutive years.

Gimnazije. The *gimnazija* is a general modern school providing more advanced and comprehensive education than the primary school. The aims of the *gimnazija* are to broaden pupils' knowledge of the natural and social sciences and of technology, to contribute towards the academic, physical, social, moral and aesthetic education of pupils so as to prepare them for playing their part in social and cultural life, to develop their natural abilities and reveal their vocation and to help them in choosing a branch of higher education and a profession.

Entrance to the *gimnazije* is by competitive examination. Pupils may choose between two courses—social studies and languages, or natural sciences and mathematics.

In the first year the curriculum and the syllabus for individual subjects are the same for all pupils, but in the second year they begin to specialize in the field of their choice. This system of two optional courses of study is designed to enable pupils to acquire a broader and deeper knowledge of the subjects in which they intend to specialize, and to help them to display their natural abilities and follow their individual bent, thus making it easier for them to choose their future profession. The methods employed by the *gimnazije* include formal lessons, practical work, productive work, and independent activities.

1. Second optional language in the last two years.

The report on each pupil should cover the whole of his work. In addition to examination results, it should take into consideration the effort made by the pupil, his industry, the initiative and discipline he shows in his work, his skill in applying the knowledge he has acquired, his all-round ability and any special gifts. Pupils' success in assimilating the subjects taught is assessed by numerical marking and

written comments. The following examinations are held in the *gimnazija*: complementary examinations in subjects in which the pupil has not reached a satisfactory standard during the school year; special examinations for 'free' pupils; examinations in some of the subjects included in the curriculum of a class or in all these subjects if pupils, for some proper reason, could not receive a mark at the end of the academic year; leaving examinations; supplementary examinations.

All pupils who successfully complete the fourth year of the *gimnazija* pass the leaving examination.

The teachers in *gimnazije* must hold a university degree in arts or science. Appointments and promotion follow the same rules as for course instructors in the upper classes of primary schools.

Vocational and technical schools

Schools for skilled workers. These are practical training and apprenticeship schools—the former control and supervise the vocational training provided in special workshops or a factory or some other establishment. There are several types of schools for skilled workers, industrial and trade schools, schools for building, agriculture, forestry, communications, economics and commerce, schools of hotel management, administrative schools and schools of medicine (the latter also train male and female nurses and midwives).

The general subjects taught are the mother tongue, history, geography, establishment and organization of enterprises and labour legislation, physical culture, preparatory military training, mathematics, physics, chemistry and hygiene. In addition, vocational subjects are taught for five hours a week in the first year and for eight hours in the second and third years.

There are also schools for highly skilled workers, which enrol persons who have already been doing skilled work in industry.

Technical schools. These schools are for the training of industrial technicians. They provide both theoretical courses (general courses concentrating mainly on the natural and social sciences and vocational subjects) and practical training. The pupils attend lectures, carry out laboratory experiments and tests, draw up plans, do practical work in the school workshops and on model working sites, work during their vacation in industrial undertakings and establishments and go on educational excursions. There are various types of technical schools—for textiles, chemical industries, machinery, the wood industry, skin-dressing, ship-building, high-tension and low-tension electrotechnics, etc.—and some provide several different courses.

Vocational schools for commerce and economics and the public services. These schools train middle-ranking professional staff, mostly in the spheres of medicine, commerce and economics, and agriculture.

The schools of medicine train medical assistants, health technicians, dental technicians, dentists, midwives, etc. They admit pupils who have completed the primary course and 2 years' general secondary schooling, and provide a course lasting 3 years, after which students sit for an examination which entitles them to a diploma. The curriculum includes lectures, tests and exercises both in and outside the school, group work, educational excursions and practical work in health establishments during vacation. In the second term of the last year, students are fully engaged in professional work. The courses are given by doctors who bear the title of honorary professors.

The schools of commerce and economics provide a 4-year course based on completion of primary school. An idea of the curriculum can be gained from the following table.

TIME-TABLE FOR VOCATIONAL SCHOOLS OF ECONOMICS

Total	33	33	33	34

On completion of the course, students sit for an examination which entitles them to a diploma. The teaching staff consists of trained teachers and a few specialists (economists and jurists).

The schools of agriculture are similar to technical schools in the form of training given—they provide both theoretical training (general and vocational) and practical training (in nursery gardens and on farms). The course lasts 4 years, and is open to pupils who have completed primary school or the course at an agricultural school for skilled workers. There is a final diploma examination.

The other schools in this category are schools of building, surveying, mines, geology, communications (road, sea or river), the various types of commercial schools, schools for tourist hotel keepers, librarians' schools and schools offering specialized courses in the different branches of agriculture and forestry (viticulture, fruit-growing, agricultural machinery, forestry and hydro-meteorology).

Art schools. As well as a general education, these schools provide training in a specific branch of art or in occupations involving a knowledge of art. The pupils are trained either to perform work of an artistic nature or to continue the study of the particular branch of art they have chosen. They must have completed the primary course and they

take an entrance examination to test their artistic ability. The majority of these schools are schools of music, painting, applied art and drama.

Teacher training schools

These include ordinary teacher training schools and schools for training teachers of domestic science or special subjects, infant school teachers and physical culture teachers—the purpose of all schools is to train teachers for primary schools. Admission is by competitive examination. The course is of 5 years' duration, and the curriculum includes the following subjects: mother tongue (language and literature), history, geography, mathematics, biology, physics, chemistry, hygiene, elementary agriculture, domestic science, handwork, methodology and work in schools, pedagogy, history of pedagogy, child psychology and educational psychology, logic, philosophy, foreign language, music, drawing and physical culture. Teacher training schools have primary classes attached to them, in which trainees carry out practice teaching. In the second half of their final year, they teach for periods of a fortnight in primary schools. At the end of the course, they take an examination, and if successful obtain a diploma. The examination consists of written tests on the candidates' mother tongue and on pedagogy, and oral tests on the mother tongue and on pedagogical subjects. There is also a practical examination—candidates give a class lesson.

Out-of-class activities

Secondary school pupils belong to the Youth Organization. They have their own cultural and sports associations, and play an active part in the internal life of the school they attend.

The changes which have been introduced as part of the educational reform attach great importance to the pupils' free activities. Pupils may join various organizations, according to their individual aptitudes, and this gives them the best possible opportunity to develop their special abilities, give full play to their intellectual curiosity, learn more about the subjects studied in class, and apply their knowledge. The various types of activity are run by the pupils themselves and this exercise in self-government is a valuable part of their social education. Teaching and free activity are really two complementary aspects of a single educational process.

TRENDS AND PROBLEMS

The reform of the educational system, which was begun in 1955, is not yet complete. Schools which provide a general education are now well developed, and the new regulations have already produced satisfactory results, but much still remains to be done in vocational education. However, the General Law on Education has laid down the lines along which this type of instruction is to develop.

As well as a number of difficulties of a transitory nature, there are two more serious problems. The first is the shortage of suitably qualified teachers. Although there has been a marked increase in the number of students who hold the diploma of the Faculty of Arts or the Faculty of Science and Mathematics, and in the number of students who have obtained the diplomas of the higher pedagogical schools and teacher training schools, there are still not enough teachers to meet the nation's needs, particularly in vocational schools. Apart from the quantitative aspect of the problem, the implementation of the reform calls for a high standard of training and an increased amount of work on the part of the teachers, for example their participation in the various types of free activity carried out by the pupils. The second major problem is the shortage of buildings and school equipment.

STATISTICS

Population (mid-year 1958 estimate): 18,189,000.
Area: 98,766 square miles; 255,804 square kilometres.
Population density: 184 per square mile; 71 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment (not including some 44,000 adults attending various schools for general education and vocational training) exceeded 2.7 million, which was about 15 per

cent of the total population. Pupils receiving their 8-year compulsory education, whether in primary or in secondary schools, represented 86 per cent of the total enrolment. Secondary education beyond this stage accounted for 3 per cent in general secondary schools, 7 per cent in vocational schools, and less than 1 per cent in teacher training schools. Higher education, including teacher training colleges, had 4 per cent of the total enrolment. The proportion of girls was 47 per cent in primary and general secondary education, 25 per cent in vocational schools, 67 per cent in teacher training schools, 52 per cent in teacher training colleges, and 30 per cent in higher general and technical education. Compared with 1953/54, enrolment had increased by 25 per cent in primary education, 4 per cent in general secondary education, 31 per cent in vocational schools, 14 per cent in teacher training, and 44 per cent in higher general and technical education. For all levels there was a 25 per cent increase between 1953 and 1957. The enrolment of girls increased by 28 per cent, showing a slightly higher proportion of the total enrolment in each category except general and technical higher education. (See Table 4.)

Enrolment trends in secondary education, 1949–57. There was no marked trend in the three categories of secondary education in the period from 1949 to 1957. (See Table 2.)

Examination results in secondary education, 1953–57. The number of certificates of general secondary schools increased by 52 per cent between 1953 and 1957, but there was a decline in the number of vocational school diplomas after 1953, and of teacher training school diplomas after 1954. In 1957 girls received 44 per cent of the general secondary certificates awarded, 39 per cent of the vocational diplomas, and 67 per cent of the teacher training diplomas. (See Table 3.)

Educational finance, 1956. In the fiscal year beginning in January 1956, recurring expenditure for education amounted to 31,900 million dinars, averaging nearly 1,800 dinars per inhabitant, as compared with 800 dinars per inhabitant reported for 1953. Table 4B shows the distribution of recurring expenditure by level and type of education.

Note. Data presented in this table are not comparable with those given in the previous edition of the *World Survey of Education*. In particular, all pupils in the higher classes (5–8) of 8-year primary schools and in the lower classes (1–4) of secondary schools, as well as in junior (4-year) secondary schools, previously classified under secondary education, are now shown under primary education.

1. Not including teachers of the primary classes of the secondary schools and 7,620 part-time teachers in 1957/58, 6,359 in 1956/57, 5,473 in 1955/56, 3,991 in 1954/55, and 1,701 in 1953/54.
2. Including teachers of the primary classes.
3. Not including part-time teachers. The numbers for the secondary general, vocational education and teacher training are as follows: 8,630 in 1957/58, 8,193 in 1956/57, 8,220 in 1955/56, 7,719 in 1954/55 and 7,285 in 1953/54.
4. A part of the enrolment at the teacher training colleges is also included under 'general and technical' higher education.

NEW HEBRIDES

Anglo-French Condominium

The New Hebrides group is administered for some purposes jointly, for others unilaterally, as provided for by the Anglo-French Convention of 27 February 1906 and a protocol of 6 August 1914. The British and French Resident Commissioners are responsible respectively to the High Commissioner, Western Pacific, stationed at Honiara in the British Solomon Islands Protectorate, and the High Commissioner for the Pacific Ocean and the New Hebrides and Governor of New Caledonia, stationed at Nouméa.

Education is not a joint responsibility, each of the co-sovereign powers having its own school system. The Condominium pays a subsidy to each of the national education services.

BRITISH SCHOOL SYSTEM

Education is provided by five Christian missions with financial assistance from the British Administration. In 1959 there were 7,774 children in 273 schools. The majority of pupils attend village schools for at least four years, some continuing for an additional period of up to six years. In Vila, a school controlled by a local parents' association and assisted by the British Administration, provides primary education for children of all races.

Facilities for the provision of secondary education, in the sense normally understood in British territories, do not yet exist in the New Hebrides. British government scholarships are, however, offered annually to enable a small number of selected students to continue their academic studies or to obtain vocational training in other parts of the Pacific.

In 1957 an educational survey was carried out on behalf of the British Administration to find out in what way assistance could be given to the missions. In May 1959 a Senior Education Officer took up his duties in the territory. Subsequently a conference attended by representatives of all five missions concerned in secular education discussed the organization of education, the improvement of teacher training and curricula by co-ordinated effort, and the nature of financial assistance to be given in the future. It is intended that a British Educational Advisory

Committee shall shortly be established to examine educational problems in greater detail.

FRENCH SCHOOL SYSTEM

Education in government schools is entirely free and open to all without distinction of race or creed. From 1960 there will be nine government primary schools, five of them with accommodation for boarders. Besides these official establishments there are 12 private schools with about 1,340 pupils.

The French Resident Commissioner exercises general control over the school system. Professional supervision of public schools is the responsibility of a primary school inspector. Private schools have their own supervisory service.

The special French budget of the New Hebrides is assisted to the extent of 60 per cent by funds from France and meets all costs of public education. The private schools are subsidized for building purposes through grants made by the Assistance and Co-operation Fund (FAC), which has replaced the Investment Fund for Economic and Social Development in the overseas territories (FIDES).

Schools take children from 5 to 14 years of age. Teaching is entirely in French. Native children who at the time of their enrolment have little or no knowledge of this language spend two years in preparatory classes, after which they enter the usual primary course leading to the *certificat d'études primaires*. The curriculum is similar to that in French schools, the teaching of science, history and geography being adapted to local needs.

Except for the complementary classes (*cours complémentaires*) at the government school at Port Vila and a vocational training centre, there is no post-primary education in the New Hebrides. Children wishing to continue their studies go to New Caledonia. They may be admitted to the sixth class (first year in secondary school—see diagram of French school system on page 479) after their school report has been examined by an entrance selection committee; otherwise they sit for an entrance examination. If they stay on at school in the New Hebrides until they have their Primary School Leaving Certificate (normally at age 14), they may go straight into the fourth year class of the *cours complémentaire*.

Children in the highest primary classes and in the complementary section do practical work (metalwork and carpentry for the boys, dressmaking, sewing and child welfare for the girls).

At Port Vila, the residential vocational training centre, just completed, will have room for 70 boarders. Children with some manual ability are also admitted after a psychotechnical test to the Centre de Formation Professionnelle Rapide de Nouville, at Nouméa, New Caledonia, which is primarily concerned with training skilled tradesmen. Pupils may also attend technical courses in New Caledonia.

There is no teacher training school. Teaching assistants (*moniteurs*) receive in-service training under the guidance of senior teachers trained in France.

[*Text revised by the Senior Education Officer, British Residency, Vila, in June 1960, and by the French National Commission for Unesco in October 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 56,000.
Area: 5,700 square miles; 14,763 square kilometres.
Population density: 10 per square mile; 3.8 per square kilometre.

Summary of school statistics, 1953–57. There are two school systems in this territory. The French system reported a total enrolment of 1,321 pupils in 1957/58 (not including 15 adults in the French language course for natives). In the British school system, there were 2,216 pupils reported for 1954/55 (see *World Survey of Education:* II—*Primary Education*). Later figures for the British schools are, however, included in the descriptive text above. In the French system primary schools, 39 per cent of the pupils were girls, and there was an average of 33 pupils per teacher. Between 1953 and 1957, public primary school enrolment in the French system increased by 54 per cent. Similar comparable data are not available either for the private schools or for the schools in the British system. (See table.)

Educational finance, 1958. Again for the French administration only, the territorial budget for education in 1958 amounted to 44,190,000 French francs. Of this amount, 39,170,000 francs, or 89 per cent, was spent for primary education. In addition, there was an allocation, for the 1958/59 period, of 42,700,000 francs for public education, from the Investment Fund for Economic and Social Development (FIDES). Official exchange rate: 100 French francs = 0.24 U.S. dollar.

ARAB REFUGEES FROM PALESTINE

Schools run jointly by UNRWA[1] and Unesco

THE EDUCATIONAL SYSTEM

The exodus of Arab and other non-Jewish refugees from Palestine into neighbouring lands began in the last months of 1947 and reached its height between May and August of the following year. Estimates vary widely, but it is probable that between 750,000 and 1,000,000 individuals had found temporary shelter by the end of that period either in nearby countries or in those parts of Palestine which had remained in Arab hands and were under the protection of either the Egyptian or the Transjordanian authorities.

Immediate succour was first given by the governments and charitable organizations, both Muslim and Christian, of those countries in which non-Jewish Palestinians had sought refuge. Many orphans were placed in institutions which also offered educational facilities.

The United Nations Childrens' Fund (Unicef) came into the field before the end of August 1948, and shortly thereafter a fund-raising body known as the United Nations Relief for Palestine Refugees (UNRPR) was set up to provide money for the work already being done by the International Committee of the Red Cross (CICR), the League of Red Cross Societies (LRCS) and the American Friends Service Committee (Quakers). These latter organizations co-operated with refugee educators who had themselves set up 'schools in the sand' beside the camps that were then beginning to take shape. It proved possible to

1. United Nations Relief and Works Agency.

shelter some of these classes during the following winter in disused hospital tents and to provide a minimum of school supplies from the sale of empty relief supply containers.

In 1948 Unesco first began to play a part in the education of Palestinian refugee children. On 11 November of that year, the third session of the Unesco General Conference, which was meeting in Beirut, adopted a resolution which included an authorization to the Director-General to make a study of the educational needs of the refugees and to include the refugees among those entitled to receive aid from Unesco emergency funds. A sum of $15,000 was made available soon after, and later grants during 1949 brought the total amount up to $38,000. The fourth session of the General Conference, which met in Paris in September 1949, launched a world-wide appeal for financial assistance which during that same year brought in goods and money to the value of $76,000. With the aid of all these contributions it proved possible for the voluntary agencies on the spot to establish 61 schools in the Gaza Strip, in Lebanon and Syria, and on both banks of the Jordan; these schools were attended by some 34,000 children. Substantial numbers of children also found refuge at the time in government and private schools.

The United Nations Relief and Works Agency for Palestine Refugees in the Near East (now commonly designated as UNRWA) was set up by the General Assembly of the United Nations in December 1949, and commenced operations in May 1950. UNRWA bases its authority to devote funds to educational purposes on paragraph 4 of Resolution 393(V) which was adopted by the General Assembly on 2 December 1950.

From an early stage this responsibility has been shared by UNRWA and Unesco jointly, with UNRWA assuming all administrative functions and, with the years, by far the greater share of the financial burden, and Unesco giving technical guidance and providing senior educational personnel. This partnership has been ratified at intervals by agreements between the two agencies, these agreements being modified as conditions change.

UNRWA/Unesco schools provide primary, general secondary, and vocational education for Palestine refugee children in Jordan, Lebanon, and the United Arab Republic (Gaza Area and Region of Syria). In addition, study grants are made available to Palestinian refugees attending government or private secondary schools or universities in the area. Altogether, some 180,000 young refugees benefit from educational assistance provided by the two United Nations agencies.

No formal agreements exist between UNRWA and the governments of the host countries delimiting the exact educational responsibility of the agency. From time to time, however, letters have been exchanged to clarify specific points, and in some host countries the educational projects of the agency require the prior consent of the government concerned.

THE DEVELOPMENT OF SECONDARY EDUCATION

The provision of education by UNRWA and Unesco was originally conceived as an emergency operation limited in scope and duration. During the early years of this operation it was not intended to do more than provide some facilities to keep schools for children of primary school age; and, in fact, the limitation on funds available for education made it necessary to concentrate on primary education almost to the complete exclusion of secondary.

It was not until 1953 that a modest beginning was made in attempting to provide secondary education. The agency at that stage decided to allow secondary education for a small number of gifted pupils—about 5 per cent of the primary enrolment. However, as the number of pupils who completed their primary education increased, a number of secondary classes were started in various places, and the agency in subsequent years increased the provision for general secondary education. At present, the number of children in UNRWA/Unesco secondary schools is 20,000 and it is estimated that another 15,000 are enrolled in government or private secondary schools.

Vocational training has always been a major preoccupation of UNRWA. From the early days it was felt that such training was one means of making the refugees self-supporting and indeed the United Nations General Assembly Resolution of 2 December 1950 recognized the need for 'the re-integration of the refugees into the economic life of the Near East'.

However, the method of providing training has changed considerably over the years. During the first few years (1950–52) a type of training was provided which did not meet, and was not intended to meet, any professional standards. A relatively large number of boys (2,000 in 1951) were engaged in carpentry, shoe-making, weaving, agriculture, tinsmithing, broom-making, poultry-raising, and similar occupations on an apprenticeship basis for short periods. But neither the tools nor the instructors were available to make this type of pre-vocational training, as it was called, really useful.

During a second stage (1952–53) it was proposed to organize a number of short and intensive training courses for some 5,000 to 10,000 refugees. Plans included provision for agricultural training and commercial courses as well as technical courses for carpenters, electricians, plumbers, surveyors, etc. The total budget allocated for these courses was $5,000,000. But although a large number of courses were initiated, it soon became apparent that young people could not be adequately trained in the course of a few months.

Since 1953/54 the policy with regard to vocational training has been to produce skilled craftsmen at a level considerably higher than was possible through the emergency courses. This policy, it was found, corresponds both to the need for skilled artisans in the host countries and also meets the increasing demand on the part of the young refugees for this type of training. The implementation of this policy required the establishment of fully-fledged vocational training centres, properly staffed (partly by internationally recruited instructors) and well-equipped. At present, three such centres are in operation—two in Jordan (one at Kalandia, the other at Wadi Seir) and one in the Gaza Area—and plans are well under way to establish additional centres in Jordan and in the United Arab Republic (Region of Syria). There is no doubt, according to a recent UNRWA report, that in the long run all the

graduates from theses centres will find employment, given freedom of movement and stable conditions in the area.

One important factor in the development of secondary education should be mentioned here, namely the extension of general education resulting from the increase in the level of vocational training. As indicated above, general education was originally provided at the primary level only, i.e., for a period of five or six years, depending on the country where the schools were located. This appeared to be a sufficient basis for the types of pre-vocational training or the short courses provided by the agency until 1953. But when it was decided to train skilled craftsmen (carpenters, mechanics, electricians) it soon became apparent that six years of general education was not a sufficient background for admission to the new vocational training centres—indeed eight years became soon to be considered as the minimum requirement, the alternative being to provide additional general education at the costly residential vocational training centres. And it is partly for this reason that general education in most UNRWA/Unesco schools has been extended from six to eight or nine years.

Administration

The administration of secondary education—and, for that matter, of the entire education programme for the refugees —is the responsibility of UNRWA. The agency has its headquarters in Beirut (Lebanon), and the central administration of the education programme is handled there by UNRWA's Education and Training Division.

UNRWA also maintains offices in each of the four countries or regions where it operates: Gaza, Jordan, Lebanon and the United Arab Republic (Region of Syria). To each of these field offices is attached a field education officer who is responsible for all educational activities in his area: inspection, the appointment of teachers, the preparation of budget estimates, etc. The field education officers are assisted in these functions by school supervisors or area education officers, whose duty it is to assist the teachers to teach more effectively and also to perform certain administrative functions such as checking the distribution of school supplies and equipment.

The field education officers, the area education officers, the heads of schools and the teaching staff employed by UNRWA are all Palestinian. The only non-Palestinian staff involved in the administration of the programme are the head of UNRWA's Education and Training Division and his two deputies, one for general education, the other for vocational education; these are provided by Unesco and are Unesco staff members. The head of the Education and Training Division thus has a dual responsibility: he is administratively responsible to the Director of UNRWA and technically responsible to the Director-General of Unesco.

The budget for education is subject to the varying fortunes of voluntary subscriptions from Member States of the United Nations and from Non-Member States—as is UNRWA's entire budget. Once a year the agency prepares its budget for education, on the basis of estimates submitted by the field education officers and programme recommendations drawn up by its Education and Training Division in consultation with Unesco. UNRWA's budget estimates, including those for education, are reported to the United Nations General Assembly. However, the General Assembly does not vote or approve the budget estimates of UNRWA, but merely invites Member States and Non-Member States to make available the necessary contributions.

Nevertheless, the agency has been able to increase its budget for education considerably during the past few years. In 1951, the total budget available for education was about $500,000; the budget for the year 1960, as reported to the United Nations General Assembly, was $9,600,000, $6,900,000 of which was for general primary and secondary education, $2,000,000 for vocational training, $280,000 for higher education, and $370,000 for teacher training.

The bulk of these funds is used for the salaries of educational staff and the maintenance of UNRWA/Unesco schools; but a small portion is set aside each year for subsidies to private and government schools to cover part of the tuition fees for Palestinian refugee children. This provision applies particularly to boys and girls who have completed the lower cycle of UNRWA/Unesco schools; since these schools usually offer no more than three years' secondary education pupils have to transfer to existing fully-fledged secondary schools to continue their education. During the current school year, UNRWA made study grants to approximately 15,000 secondary school pupils; the value of these grants varies from $40 to $70 per annum per pupil.

TYPES OF SECONDARY EDUCATION

General secondary schools

On completion of the five- or six-year primary school, Palestinian refugee children may or may not continue their education. If they do, only one type of school is available, namely the general secondary school. At a later age, they might seek admission to one of the vocational training centres established by UNRWA, or to one of the teacher training colleges; but this they cannot do until they have completed two or three years' general secondary education.

This lack of diversification at the post-primary level, particularly in view of the growing realization of parents that a good education is the best way for their children out of the misery of refugee life, has resulted in the fact that nearly all primary school children apply for admission to the general secondary school.

Entry to secondary schools in some countries is dependent upon the pupil's successfully passing an examination; but the policy as regards these entrance examinations is determined by the local authorities and may change from year to year. Thus, Jordan and Gaza have recently introduced such examinations, whilst in Syria, where they had been in force for several years, it was decided to abolish them.

In the main, the curriculum of the UNRWA/Unesco secondary schools is the same as that of the countries where they are located. Likewise, the same textbooks are used as in government schools; in Jordan and the United Arab Republic they are officially prescribed by the Ministry of Education.

In one respect, the teaching in UNRWA/Unesco general

secondary schools differs from the programme offered in most government and private schools—namely, the addition of handicrafts teaching for boys. In the two lower grades of UNRWA/Unesco secondary schools this subject is taught for six periods a week in workrooms specially built for this purpose. Handicrafts units were built first in the Gaza Area in 1955; the subject was introduced in Jordan in late 1957 and in Lebanon and Syria in 1959. Boys do metalwork, woodwork, and technical drawing under the supervision of academic teachers who have had short training courses by specialists. The reason why this subject was introduced was to give the curriculum a more practical basis; it was felt that crafts would help to develop initiative and that a first-hand knowledge of tools would contribute to the mastery of abstract knowledge. It is not in any way regarded as vocational or pre-vocational training; all boys take this subject as part of the regular curriculum, whether or not they later take courses in vocational training.

Vocational and technical schools

Vocational education for boys is at this stage provided mainly at three residential centres, namely in Gaza for 200 trainees, in Kalandia for 400 trainees, and Wadi Seir for 230 trainees. Plans for the establishment of two more centres, one near Damascus and one in Jordan, are well under way.

The main objective of these centres is to train productive workers. Courses include training for the building industry (surveyors, draughtsmen, carpenters, plumbers); electricity (electricians, wiremen, radio mechanics); mechanics (fitter-machinists, welders, motor mechanics). At Kalandia there is also a commercial course. In addition, the centre provides the theoretical instruction required for most of these trades, i.e., mathematics, science, English, and drawing. But the bulk of the time is spent on practical work, and the theory is given only to enable the trainees to understand the practical work. Thus, in the mechanical engineering and building trades theory occupies about 15 per cent of the time and in the more scientific courses, such as radio mechanics, 35 per cent of the time.

Most courses are of 2 years' duration. The minimum entry age is 16; entrance qualifications vary from completion of primary education to completion of the full 5-year general secondary school. The working week is 40 hours and the session 49 weeks.

In the course of the past few years, the staff of the vocational training centres have prepared a number of syllabuses and work schemes for the various training courses, as follows: Builders' 2-year course, parts I and II; Syllabus for carpenters; Scheme of work in technical drawing; Scheme of work for wiremen/cable jointers, parts I and II; Electricians' 2-year course, parts I and II; Electrical tables; Scheme of work for general science; Scheme of work in trade calculations; Scheme of work for basis fitting course.

Teacher training schools

Two teaching training colleges were established under the UNRWA/Unesco educational programme in 1956—one for men in Ramallah (Jordan) and one for women in Nablus (Jordan). Unfortunately, however, they had to be closed down in 1958 for budgetary reasons.

In 1959 the women's teacher training college was re-opened in rented premises, with 27 students in the first year and 11 in the second year. The men's college was re-opened in 1960.

The training course is of 2 years' duration. The subjects taught are Arabic (6 periods), English (6 periods), social studies (3 or 4 periods), mathematics (4 periods), education and psychology (4 periods), domestic science (1 period), religion (1 period), physical training (1 period). In addition, the trainees do practice teaching for two full days a week for periods of three weeks.

The trainees have free board and lodging and, at the women's college, receive a clothing allowance when they enter the college and £3 (Jordanian) a month for pocket money.

TRENDS AND PROBLEMS

There are two main problems that have to be solved if secondary education is to play its part in the economic and social development of the Palestinian refugee community, namely, the provision of a greater variety of programmes and a marked increase in the efficiency of the teaching in general secondary schools.

At present there is hardly any diversification of education at the secondary level. As was noted before, there is only one way leading from the secondary school to further education and that is attendance for at least three years at a general secondary school providing no options or streams to cater for the individual abilities of the children. And even then, the opportunity for 16-year-old children to choose between a practical education of the vocational or technical type and a further academic education exists theoretically only. There are fewer than 1,000 places at the vocational training centres and the teacher training colleges combined, whereas the enrolment in the lower cycle of UNRWA/Unesco general secondary schools is 20,000; and the latter number is likely to increase much faster than facilities for vocational education are expanding at present. The provision of more vocational training—which seems the obvious answer to this problem—is, however, hampered by the lack of funds. Vocational training is expensive, much more so than general education, in view of the equipment required and the necessarily lower pupil-teacher ratio, and it is therefore unlikely that the problem can be solved in this way.

The problem is aggravated by the fact that teaching in the UNRWA/Unesco general secondary schools is not as yet very efficient. In most of the schools, the children are taught to listen and to memorize—but not to think or to act or to develop a sense of creative initiative. This of course is a matter of training teachers, and it is at this point that most of the services of internationally recruited staff are applied. Of the 14 specialists currently provided by Unesco for the educational programme, 11 are employed for the improvement of the quality of education, and only 3 for administration. It is hoped that the number of specialists provided by Unesco may even be increased during the next few years, with the ultimate aim of improving the

quality of education to a point where schools meet individual needs and train young people in accordance with the requirements of the changing economic and social conditions of their environment.
